# Chapter 1

## Fasal Flasher

This repository contains Fasal Flasher Source Code. Dive right into the codebase through [AppFasal\\_Run](#) invoked in main.c !

### 1.1 Table of contents

- Context
- Project-structure
- Code-flow
- Build-Instruction
- Documentation
- Contact-Me

### 1.2 Context

Fasal Flasher is an Internal tool meant as a production floor Aid. Its primary purpose is to update the contents flash IC W25Qxx either with the contents of the Fasal Flasher onboard SD-Card or over a serial terminal over XModem protocol. The device has the following salient features

1. Powered by USB either through PC, Mobile phone or any USB source
2. File Input from either Serial console through USB connector or SD-Card
3. Slide switch to select between file source of SD-Card and Serial console (X-modem)
4. The W25Qxx flash IC in external board is powered through the Fasal Flasher and programmed over SPI
5. PushButton to trigger the transfer in the configured Mode
6. Tri-Color LED for visual indication about the process result
7. Logs over the same USB cable with information about the running application
8. File Integrity check via CRC in case of SD-Card transfer mode

9. File Integrity check inbuilt via XModem protocol in case of XModem transfer mode

Figure 1.1 Fasal Flasher Usage

### 1.3 Project-structure

1. The project is divided into the following folders
2. SourceCode/FasalFlasher/Core : Contains CubeMX Generated Files utilizing the STM HAL. These files are mostly unmodified and used as is
3. SourceCode/FasalFlasher/Drivers : STM HAL files
4. SourceCode/FasalFlasher/FATFS : FatFS library
5. SourceCode/FasalFlasher/Middlewares : Contains STM crypto library and FatFS library, used as is without any modifications
6. SourceCode/FasalFlasher/User\_Files : All custom code for the Fasal Application is present in this folder
  - (a) SourceCode/FasalFlasher/User\_Files/AppCommon : Contains modules used across the whole application, these include
    - i. SourceCode/FasalFlasher/User\_Files/AppCommon/AppIndication : Controls visual indication presented by the board
    - ii. SourceCode/FasalFlasher/User\_Files/AppCommon/AppUtility : Provides SoftTimer, Circular Buffer and other Misc utility functions
    - iii. SourceCode/FasalFlasher/User\_Files/AppCommon/CommonDefinitions : Non project specific data structures and Macros
    - iv. SourceCode/FasalFlasher/User\_Files/AppCommon/ConfigSetting : Module to check Board HW configuration
    - v. SourceCode/FasalFlasher/User\_Files/AppCommon/PushButton : PushButton module
  - (b) SourceCode/FasalFlasher/User\_Files/AppConfiguration : Application configuration options are controlled here
  - (c) SourceCode/FasalFlasher/User\_Files/AppFasal : Application code module
    - i. SourceCode/FasalFlasher/User\_Files/AppFasal/AppHelper : Helper functions for main application
    - ii. SourceCode/FasalFlasher/User\_Files/AppFasal/AppResetAndError : Error handling and reset management
  - (d) SourceCode/FasalFlasher/User\_Files/AppInterface : Modules that help Interface Sensor Adapter with external peripherals
    - i. SourceCode/FasalFlasher/User\_Files/AppInterface/Console : Debug console for getting controlling as well as reading logs
    - ii. SourceCode/FasalFlasher/User\_Files/AppInterface/xModem : xModem module built on top of UART based console module

- (e) [SourceCode/FasalFlasher/User\\_Files/AppInterrupts](#) : Callbacks and other application specific callbacks coupled closely with board specific peripherals
- (f) [SourceCode/FasalFlasher/User\\_Files/AppStorage](#) : OnBoard storage module API
  - i. [SourceCode/FasalFlasher/User\\_Files/AppStorage/AppFlashFS](#) : Filesystem based on LittleFS file system built atop W25Qxx flash IC
  - ii. [SourceCode/FasalFlasher/User\\_Files/AppStorage/AppSDFS](#) : Filesystem based on FatFS file system built atop SPI based SD-Card

## 1.4 Code-flow

1. The code flow and the corresponding modules are documented in this section
2. The code starting point is main. All HAL modules are initialized here along with Application level code housed in [AppFasal.h](#)
3. [AppFasal\\_Init](#) Initializes the application, sends startup message and sets up the TriColorLED, console and startup timer
4. The function [AppFasal\\_Run](#) is the application state-machine that drives the application
  - (a) Module level initialization is carried out in the first step
  - (b) The application then waits for the user to press the flash user button
  - (c) External flash is then initialized before progressing to the file transfer phase
  - (d) Depending on the hardware slide switch setting, the device can then proceed in one of the following modes
    - i. SD-Card Transfer Mode:
      - A. SD-Card is initialized and it is ensured that the Golden image is present
      - B. Golden image is transferred from the SD card to the external flash
      - C. CRC of the same file in SD-Card and in the now transferred flash are computed and checked against each other
    - ii. XModem Transfer Mode:
      - A. File Must be transferred over XModem 1K option though a serial terminal [Baud: 115200, Data: 8b, Stop Bit: 1b]
  - (e) In either mode, On successful reception of Golden Image, the Firmware then enters the termination stage, indicates success and waits on the flash user button stage
  - (f) In either mode failure of any of the steps prior to successful transfer results in the application state-machine indicating the failure reason and jumping back flash user button stage

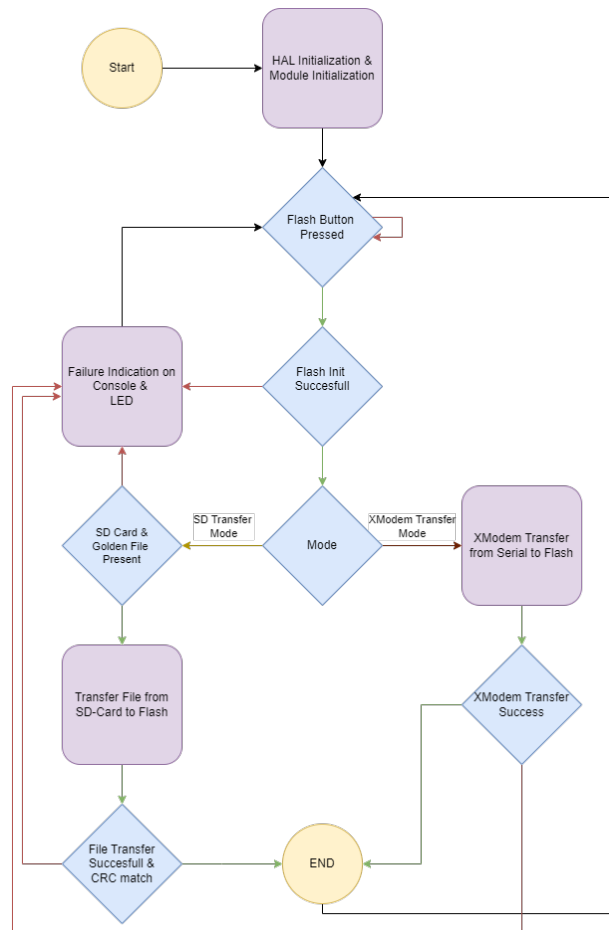

Figure 1.3 APP

## 1.5 Build-Instruction

1. Built using CubeIDE Version: 1.15.1 Build: 21094\_20240412\_1041 (UTC)
2. Both BUILD\_DEBUG and BUILD\_PROD Uses Linker script STM32f103RETX\_FLASH.ld with flash offset of 0x0800 0000, application size set to 512KB
3. The following build configurations are built into the codebase
  - (a) **BUILD\_DEBUG** : Debug build used during development with all debug symbols enabled
    - Optimization level : None
    - Symbols defined : DEBUG | STM32F103xE | USE\_HAL\_DRIVER
  - (b) **BUILD\_PROD** : Production build for filed use
    - Optimization level : Ofast
    - Symbols defined : NDEBUG | STM32F103xE | USE\_HAL\_DRIVER
4. [SourceCode/FasalFlasher/User\\_Files/AppCommon/AppConfiguration](#) for changing compile time build features

## 1.6 Docs

1. Open Index.html in any browser. Files located here Docs/html
2. Latex Generated PDF file is preset at Docs/Design\_Document/FasalNode\_FirmwareDesignDocument.pdf
3. The documentation can be generated by running batch script make\_designdocument.bat at the project root

## Chapter 4

# Data Structure Documentation

### 4.1 df\_dataparam Struct Reference

#### Data Fields

- uint8\_t **txbuff** [DF\_PAGE\_SIZE]
- uint8\_t **rxbuff** [DF\_PAGE\_SIZE]
- uint8\_t **txbuff\_len**
- uint8\_t **rxbuff\_len**
- uint8\_t **rxbuff\_readpos**
- uint8\_t **df\_mode**

The documentation for this struct was generated from the following file:

- [W25Qxx.h](#)

### 4.2 lfs Struct Reference

Collaboration diagram for lfs:

## Data Structures

- struct [lfs\\_free](#)
- struct [lfs\\_mlist](#)

## Data Fields

- [lfs\\_cache\\_t](#) **rcache**
- [lfs\\_cache\\_t](#) **pcache**
- [lfs\\_block\\_t](#) **root** [2]
- struct [lfs::lfs\\_mlist](#) \* **mlist**
- [uint32\\_t](#) **seed**
- [lfs\\_gstate\\_t](#) **gstate**
- [lfs\\_gstate\\_t](#) **gdisk**
- [lfs\\_gstate\\_t](#) **gdelta**
- struct [lfs::lfs\\_free](#) **free**
- const struct [lfs\\_config](#) \* **cfg**
- [lfs\\_size\\_t](#) **name\_max**
- [lfs\\_size\\_t](#) **file\_max**
- [lfs\\_size\\_t](#) **attr\_max**

The documentation for this struct was generated from the following file:

- [lfs.h](#)

## 4.3 lfs\_attr Struct Reference

### Data Fields

- [uint8\\_t](#) **type**
- void \* **buffer**
- [lfs\\_size\\_t](#) **size**

The documentation for this struct was generated from the following file:

- [lfs.h](#)

## 4.4 lfs\_cache Struct Reference

```
#include <lfs.h>
```

### Data Fields

- [lfs\\_block\\_t](#) **block**
- [lfs\\_off\\_t](#) **off**
- [lfs\\_size\\_t](#) **size**
- [uint8\\_t](#) \* **buffer**

The documentation for this struct was generated from the following file:

- [lfs.h](#)

## 4.5 lfs\_commit Struct Reference

### Data Fields

- lfs\_block\_t **block**
- lfs\_off\_t **off**
- lfs\_tag\_t **ptag**
- uint32\_t **crc**
- lfs\_off\_t **begin**
- lfs\_off\_t **end**

The documentation for this struct was generated from the following file:

- lfs.c

## 4.6 lfs\_config Struct Reference

### Data Fields

- void \* **context**
- int(\* **read**)(const struct lfs\_config \*c, lfs\_block\_t block, lfs\_off\_t off, void \*buffer, lfs\_size\_t size)
- int(\* **prog**)(const struct lfs\_config \*c, lfs\_block\_t block, lfs\_off\_t off, const void \*buffer, lfs\_size\_t size)
- int(\* **erase**)(const struct lfs\_config \*c, lfs\_block\_t block)
- int(\* **sync**)(const struct lfs\_config \*c)
- lfs\_size\_t **read\_size**
- lfs\_size\_t **prog\_size**
- lfs\_size\_t **block\_size**
- lfs\_size\_t **block\_count**
- int32\_t **block\_cycles**
- lfs\_size\_t **cache\_size**
- lfs\_size\_t **lookahead\_size**
- void \* **read\_buffer**
- void \* **prog\_buffer**
- void \* **lookahead\_buffer**
- lfs\_size\_t **name\_max**
- lfs\_size\_t **file\_max**
- lfs\_size\_t **attr\_max**
- lfs\_size\_t **metadata\_max**

The documentation for this struct was generated from the following file:

- lfs.h

## 4.7 lfs\_file::lfs\_ctz Struct Reference

### Data Fields

- lfs\_block\_t **head**
- lfs\_size\_t **size**

The documentation for this struct was generated from the following file:

- lfs.h

## 4.8 lfs\_dir Struct Reference

Collaboration diagram for lfs\_dir:

### Data Fields

- struct `lfs_dir` \* `next`
- `uint16_t` `id`
- `uint8_t` `type`
- `lfs_mdir_t` `m`
- `lfs_off_t` `pos`
- `lfs_block_t` `head` [2]

The documentation for this struct was generated from the following file:

- `lfs.h`

## 4.9 lfs\_dir\_commit\_commit Struct Reference

Collaboration diagram for lfs\_dir\_commit\_commit:

### Data Fields

- `lfs_t * lfs`
- `struct lfs_commit * commit`

The documentation for this struct was generated from the following file:

- `lfs.c`

## 4.10 lfs\_dir\_find\_match Struct Reference

Collaboration diagram for `lfs_dir_find_match`:

### Data Fields

- `lfs_t * lfs`
- `const void * name`
- `lfs_size_t size`

The documentation for this struct was generated from the following file:

- `lfs.c`

## 4.11 lfs\_dir\_traverse Struct Reference

Collaboration diagram for lfs\_dir\_traverse:

### Data Fields

- const [lfs\\_mdir\\_t](#) \* **dir**
- [lfs\\_off\\_t](#) **off**
- [lfs\\_tag\\_t](#) **ptag**
- const struct [lfs\\_mattr](#) \* **attrs**
- int **attrcount**
- [lfs\\_tag\\_t](#) **tmask**
- [lfs\\_tag\\_t](#) **ttag**
- [uint16\\_t](#) **begin**
- [uint16\\_t](#) **end**
- [int16\\_t](#) **diff**
- int(\* **cb** )(void \*data, [lfs\\_tag\\_t](#) tag, const void \*buffer)
- void \* **data**
- [lfs\\_tag\\_t](#) **tag**
- const void \* **buffer**
- struct [lfs\\_diskoff](#) **disk**

The documentation for this struct was generated from the following file:

- [lfs.c](#)

## 4.12 lfs\_diskoff Struct Reference

### Data Fields

- [lfs\\_block\\_t](#) **block**
- [lfs\\_off\\_t](#) **off**

The documentation for this struct was generated from the following file:

- [lfs.c](#)

## 4.13 lfs\_fcrc Struct Reference

### Data Fields

- lfs\_size\_t **size**
- uint32\_t **crc**

The documentation for this struct was generated from the following file:

- lfs.c

## 4.14 lfs\_file Struct Reference

Collaboration diagram for lfs\_file:

### Data Structures

- struct [lfs\\_ctz](#)

### Data Fields

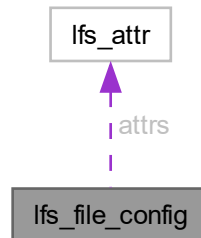

- struct [lfs\\_file](#) \* **next**
- uint16\_t **id**
- uint8\_t **type**
- [lfs\\_mdir\\_t](#) **m**
- struct [lfs\\_file::lfs\\_ctz](#) **ctz**
- uint32\_t **flags**
- lfs\_off\_t **pos**
- lfs\_block\_t **block**
- lfs\_off\_t **off**
- [lfs\\_cache\\_t](#) **cache**
- const struct [lfs\\_file\\_config](#) \* **cfg**

The documentation for this struct was generated from the following file:

- lfs.h

## 4.15 lfs\_file\_config Struct Reference

Collaboration diagram for lfs\_file\_config:

### Data Fields

- void \* **buffer**
- struct `lfs_attr` \* **attrs**
- lfs\_size\_t **attr\_count**

The documentation for this struct was generated from the following file:

- lfs.h

## 4.16 lfs::lfs\_free Struct Reference

### Data Fields

- lfs\_block\_t **off**
- lfs\_block\_t **size**
- lfs\_block\_t **i**
- lfs\_block\_t **ack**
- uint32\_t \* **buffer**

The documentation for this struct was generated from the following file:

- lfs.h

## 4.17 lfs\_fs\_parent\_match Struct Reference

Collaboration diagram for lfs\_fs\_parent\_match:

### Data Fields

- `lfs_t * lfs`
- `const lfs_block_t pair [2]`

The documentation for this struct was generated from the following file:

- `lfs.c`

## 4.18 lfs\_fsinfo Struct Reference

### Data Fields

- `uint32_t disk_version`
- `lfs_size_t name_max`
- `lfs_size_t file_max`
- `lfs_size_t attr_max`

The documentation for this struct was generated from the following file:

- `lfs.h`

## 4.19 lfs\_gstate Struct Reference

### Data Fields

- uint32\_t **tag**
- lfs\_block\_t **pair** [2]

The documentation for this struct was generated from the following file:

- lfs.h

## 4.20 lfs\_info Struct Reference

### Data Fields

- uint8\_t **type**
- lfs\_size\_t **size**
- char **name** [LFS\_NAME\_MAX+1]

The documentation for this struct was generated from the following file:

- lfs.h

## 4.21 lfs\_mattr Struct Reference

### Data Fields

- lfs\_tag\_t **tag**
- const void \* **buffer**

The documentation for this struct was generated from the following file:

- lfs.c

## 4.22 lfs\_mdir Struct Reference

### Data Fields

- lfs\_block\_t **pair** [2]
- uint32\_t **rev**
- lfs\_off\_t **off**
- uint32\_t **etag**
- uint16\_t **count**
- bool **erased**
- bool **split**
- lfs\_block\_t **tail** [2]

The documentation for this struct was generated from the following file:

- lfs.h

## 4.23 lfs::lfs\_mlist Struct Reference

Collaboration diagram for lfs::lfs\_mlist:

### Data Fields

- struct [lfs\\_mlist](#) \* **next**
- uint16\_t **id**
- uint8\_t **type**
- [lfs\\_mdir\\_t](#) **m**

The documentation for this struct was generated from the following file:

- [lfs.h](#)

## 4.24 lfs\_superblock Struct Reference

### Data Fields

- uint32\_t **version**
- lfs\_size\_t **block\_size**
- lfs\_size\_t **block\_count**
- lfs\_size\_t **name\_max**
- lfs\_size\_t **file\_max**
- lfs\_size\_t **attr\_max**

The documentation for this struct was generated from the following file:

- [lfs.h](#)

## 4.25 sConsoleCommand\_t Struct Reference

```
#include <Console.h>
```

### Data Fields

- const char \* **CommandName**
- char **CommandStr** [BUFFER\_SIZE\_8]
- volatile bool **IsCommandRaised**
- volatile bool **IsCommandServiced**
- [pfConsoleCommandActor\\_t](#) **pfConsoleCommandActor**

#### 4.25.1 Detailed Description

The documentation for this struct was generated from the following files:

- [AppCommon/Console/Console.h](#)
- [AppInterface/Console/Console.h](#)

## 4.26 sElevatedPromptData\_t Struct Reference

```
#include <Console.h>
```

### Data Fields

- char **buf** [CONSOLE\_PROMPT\_BUFFER\_SIZE]

#### 4.26.1 Detailed Description

The documentation for this struct was generated from the following files:

- [AppCommon/Console/Console.h](#)
- [AppInterface/Console/Console.h](#)

## 4.27 sFlashFS\_t Struct Reference

```
#include <AppFlash_API.h>
```

Collaboration diagram for sFlashFS\_t:

#### Data Fields

- bool **IsMounted**
- [lfs\\_t fs](#)
- [lfs\\_file\\_t fileHandles](#) [eFS\_MAX]

#### 4.27.1 Detailed Description

The documentation for this struct was generated from the following file:

- [AppFlash\\_API.h](#)

## 4.28 sLed\_t Struct Reference

```
#include <TriColorLED.h>
```

Collaboration diagram for sLed\_t:

### Data Fields

- const [sSTMGpioPinWrapper\\_t](#) \* **pcLedPin**
- [eLEDState\\_t](#) **ledState**
- const [sLEDPins\\_t](#) \* **pcLedPin**

#### 4.28.1 Detailed Description

The documentation for this struct was generated from the following files:

- [ApplIndication/TriColorLED/TriColorLED.h](#)
- [TriColorLED/TriColorLED.h](#)

## 4.29 sLEDPins\_t Struct Reference

```
#include <TriColorLED.h>
```

### Data Fields

- GPIO\_TypeDef \* **LEDPort**
- uint16\_t **LEDPin**

#### 4.29.1 Detailed Description

The documentation for this struct was generated from the following file:

- [TriColorLED/TriColorLED.h](#)

## 4.30 sSDFS\_t Struct Reference

```
#include <AppSD_API.h>
```

### Data Fields

- bool **IsMounted**
- FATFS **fs**
- FIL **fileHandles** [eFS\_MAX]

### 4.30.1 Detailed Description

The documentation for this struct was generated from the following file:

- [AppSD\\_API.h](#)

## 4.31 sSoftTimer\_t Struct Reference

```
#include <SoftTimer.h>
```

### Data Fields

- bool **IsArmed**
- bool **IsPeriodic**
- uint32\_t **currentTicks**
- uint32\_t **setTicks**
- pfCallBack\_t **pfCallBack**

### 4.31.1 Detailed Description

The documentation for this struct was generated from the following file:

- [SoftTimer.h](#)

## 4.32 sSTMGpioPinWrapper\_t Struct Reference

```
#include <CommonDefinitions.h>
```

### Data Fields

- GPIO\_TypeDef \* **GpioPort**
- uint16\_t **GpioPin**

### 4.32.1 Detailed Description

The documentation for this struct was generated from the following file:

- [CommonDefinitions.h](#)

## 4.33 sTriColorIndication\_t Struct Reference

```
#include <TriColorLED.h>
```

### Data Fields

- bool **IsBlinkNeeded**
- [eTriColorLEDStates\\_t](#) **ledState**
- [eTriColorLEDBlinkPeriod\\_t](#) **ledBlinkPeriod**

### 4.33.1 Detailed Description

The documentation for this struct was generated from the following files:

- [ApplIndication/TriColorLED/TriColorLED.h](#)
- [TriColorLED/TriColorLED.h](#)

## 4.34 sTricolorLED\_t Struct Reference

```
#include <TriColorLED.h>
```

Collaboration diagram for sTricolorLED\_t:

## Data Fields

- bool **IsInitialized**
- bool **IsBlinkEnabled**
- size\_t **blinkTicksSet**
- size\_t **blinkTicksCurrent**
- [eTriColorLEDStates\\_t](#) **triColorLEDState**
- [eTriColorLEDStates\\_t](#) **prevOnLEDState**
- [sLed\\_t](#) **Leds** [eLED\_MAX]
- [sLed\\_t](#) **Leds2** [eLED\_MAX]

### 4.34.1 Detailed Description

### 4.34.2 Field Documentation

#### 4.34.2.1 Leds2

```
sLed_t sTricolorLED_t::Leds2
```

Duplicate set of LED pins that shows the same indication.

Duplicate set of LED pins that shows the same indication

The documentation for this struct was generated from the following files:

- [ApplIndication/TriColorLED/TriColorLED.h](#)
- [TriColorLED/TriColorLED.h](#)

## 4.35 sTriColorLEDState\_t Struct Reference

```
#include <TriColorLED.h>
```

## Data Fields

- [eLEDState\\_t](#) **LedState** [eLED\_MAX]

### 4.35.1 Detailed Description

The documentation for this struct was generated from the following files:

- [ApplIndication/TriColorLED/TriColorLED.h](#)
- [TriColorLED/TriColorLED.h](#)

## 4.36 w25qxx\_t Struct Reference

### Data Fields

- W25QXX\_ID\_t **ID**
- uint8\_t **UniqID** [8]
- uint16\_t **PageSize**
- uint32\_t **PageCount**
- uint32\_t **SectorSize**
- uint32\_t **SectorCount**
- uint32\_t **BlockSize**
- uint32\_t **BlockCount**
- uint32\_t **CapacityInKiloByte**
- uint8\_t **StatusRegister1**
- uint8\_t **StatusRegister2**
- uint8\_t **StatusRegister3**
- uint8\_t **Lock**

The documentation for this struct was generated from the following file:

### 5.1.2 Function Documentation

#### 5.1.2.1 `__attribute__()`

```
__attribute__ (
    (unused) )
```

convert eDeviceResetCause\_t enum to strings for printing

Delete File.

Write to a file in FatFS.

#### Parameters

|                    |                                                                            |
|--------------------|----------------------------------------------------------------------------|
| <i>pMe</i>         | FatFS wrapper instance                                                     |
| <i>fileEnum</i>    | File to be written into                                                    |
| <i>IsAppend</i>    | Pass true to write to file in append mode, false to write at the beginning |
| <i>pInWriteBuf</i> | data to be written is passed here                                          |
| <i>bufSize</i>     | size of buffer passed for writing                                          |

#### Returns

eStorageFSStatus\_t

#### Parameters

|                 |                        |
|-----------------|------------------------|
| <i>pMe</i>      | FatFS wrapper instance |
| <i>fileEnum</i> | File to be deleted     |

**Returns**

eStorageFSStatus\_t

**5.1.2.2 AppCommon\_PreResetRoutine()**

```
static void AppCommon_PreResetRoutine ( ) [static]
```

Function to be invoked prior to resetting the system to recover from an hard fault/error.

< Device has been reset so set up-time back to ZeroHere is the caller graph for this function:

**5.1.2.3 AppCommon\_GetErrorCode()**

```
eDeviceErrorCode_t AppCommon_GetErrorCode ( )
```

Setter for `gErrorCode`, previous values are unaffected.

**Returns**

eDeviceErrorCode\_t

Here is the caller graph for this function:

#### 5.1.2.4 AppCommon\_AccumlateErrorCode()

```
void AppCommon_AccumlateErrorCode (
    eDeviceErrorCode_t err )
```

Setter for [gErrorCode](#), previous values are unaffected.

Here is the caller graph for this function:

#### 5.1.2.5 AppCommon\_ResetErrorCode()

```
void AppCommon_ResetErrorCode ( )
```

Reset error Code.

Here is the caller graph for this function:

#### 5.1.2.6 AppCommon\_DetermineResetCause()

```
void AppCommon_DetermineResetCause ( )
```

Function to determine why the device was reset, also sets global [gDeviceResetCause](#).

##### Note

should be called before peripheral initialization

### 5.1.2.7 AppCommon\_GetCachedResetCause()

```
eDeviceResetCause_t AppCommon_GetCachedResetCause ( )
```

Getter for [gDeviceResetCause](#).

#### Note

Assumes [AppCommon\\_DetermineResetCause](#) is called at startup

#### Returns

eDeviceResetCause\_t

### 5.1.2.8 AppCommon\_HALErrorHandler()

```
void AppCommon_HALErrorHandler ( )
```

STM HAL error handler.

#### Warning

This function resets the device

Here is the call graph for this function:

### 5.1.2.9 AppCommon\_STMErrorHandler()

```
void AppCommon_STMErrorHandler ( )
```

STM Fault error handler.

#### Warning

This function resets the device

Here is the call graph for this function:

### 5.1.2.10 \_\_assert\_func()

```
void __assert_func (
    const char * file,
    int line,
    const char * func,
    const char * failedexpr )
```

Assert failure error handler.

#### Warning

This function resets the device

Here is the call graph for this function:

### 5.1.2.11 AppCommon\_PrintDelimiter()

```
void AppCommon_PrintDelimiter ( )
```

Utility function to print delimiter used in the console.

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.1.2.12 AppCommon\_PrintLineBreak()

```
void AppCommon_PrintLineBreak ( )
```

Utility function to print delimiter used in the console.

Here is the call graph for this function:

#### 5.1.2.13 AppCommon\_StartUpMessagePrint()

```
void AppCommon_StartUpMessagePrint ( )
```

Start up message print.

Here is the call graph for this function:

#### 5.1.2.14 AppCommon\_GetStatusString()

```
const char *const AppCommon_GetStatusString (
    int status )
```

Utility function returns "Success" or "failure" based on status code passed.

See also

[gcStatusStringHelper](#)

Parameters

|               |                                                                                |
|---------------|--------------------------------------------------------------------------------|
| <i>status</i> | 0 is success across all modules in the code-base , non 0 is treated as failure |
|---------------|--------------------------------------------------------------------------------|

**Returns**

const char\* const

Here is the caller graph for this function:

## 5.1.3 Variable Documentation

### 5.1.3.1 gDeviceResetCause

```
eDeviceResetCause_t gDeviceResetCause = eRESET_CAUSE_UNKNOWN [static]
```

Global that maintains reset cause

### 5.1.3.2 gErrorCode

```
eDeviceErrorCode_t gErrorCode = eERR_NO_ERRORS [static]
```

Global that maintains error cause

### 5.1.3.3 gcStatusStringHelper

```
const char* gcStatusStringHelper[eSTATUS_STRING_MAX] [static]
```

**Initial value:**

```
=
{
    [eSUCCESS_STRING] = "Success",
    [eFAILURE_STRING] = "Failure"
}
```

Map [eStatusPrintHelperEnum\\_t](#) to string. Used by [AppCommon\\_GetStatusString](#).

## 5.2 AppCommon.h File Reference

### Macros

- `#define LOOP\_FOREVER {while(1);}`

## Enumerations

## 5.2.2 Macro Definition Documentation

### 5.2.2.1 LOOP\_FOREVER

```
#define LOOP_FOREVER {while(1);}
```

Utility MACRO to loop forever

## 5.2.3 Enumeration Type Documentation

### 5.2.3.1 eStatusPrintHelperEnum\_t

```
enum eStatusPrintHelperEnum_t
```

Enum for status helper.

### 5.2.3.2 eDeviceResetCause\_t

```
enum eDeviceResetCause_t
```

Possible STM32 system reset causes.

### 5.2.3.3 eDeviceErrorCode\_t

```
enum eDeviceErrorCode_t
```

Possible Errors in application.

## 5.2.4 Function Documentation

### 5.2.4.1 AppCommon\_PrintDelimiter()

```
void AppCommon_PrintDelimiter ( )
```

Utility function to print delimiter used in the console.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.2.4.2 AppCommon\_PrintLineBreak()

```
void AppCommon_PrintLineBreak ( )
```

Utility function to print delimiter used in the console.

Here is the call graph for this function:

### 5.2.4.3 AppCommon\_StartUpMessagePrint()

```
void AppCommon_StartUpMessagePrint ( )
```

Start up message print.

Here is the call graph for this function:

### 5.2.4.4 AppCommon\_HALErrorHandler()

```
void AppCommon_HALErrorHandler ( )
```

STM HAL error handler.

#### Warning

This function resets the device

Here is the call graph for this function:

#### 5.2.4.5 AppCommon\_STMFaultHandler()

```
void AppCommon_STMFaultHandler ( )
```

STM Fault error handler.

##### Warning

This function resets the device

Here is the call graph for this function:

#### 5.2.4.6 AppCommon\_GetStatusString()

```
const char *const AppCommon_GetStatusString (
    int status )
```

Utility function returns "Success" or "failure" based on status code passed.

##### See also

[gcStatusStringHelper](#)

##### Parameters

|               |                                                                                |
|---------------|--------------------------------------------------------------------------------|
| <i>status</i> | 0 is success across all modules in the code-base , non 0 is treated as failure |
|---------------|--------------------------------------------------------------------------------|

##### Returns

const char\* const

#### 5.2.4.7 \_\_assert\_func()

```
void __assert_func (
    const char * file,
    int line,
    const char * func,
    const char * failedexpr )
```

Assert failure error handler.

##### Warning

This function resets the device

#### 5.2.4.8 AppCommon\_DetermineResetCause()

```
void AppCommon_DetermineResetCause ( )
```

Function to determine why the device was reset, also sets global [gDeviceResetCause](#).

##### Note

should be called before peripheral initialization

#### 5.2.4.9 AppCommon\_GetCachedResetCause()

```
eDeviceResetCause_t AppCommon_GetCachedResetCause ( )
```

Getter for [gDeviceResetCause](#).

##### Note

Assumes [AppCommon\\_DetermineResetCause](#) is called at startup

##### Returns

eDeviceResetCause\_t

#### 5.2.4.10 AppCommon\_GetErrorCode()

```
eDeviceErrorCode_t AppCommon_GetErrorCode ( )
```

Setter for [gErrorCode](#), previous values are unaffected.

##### Returns

eDeviceErrorCode\_t

##### Returns

eDeviceErrorCode\_t

#### 5.2.4.11 AppCommon\_AccumlateErrorCode()

```
void AppCommon_AccumlateErrorCode (
    eDeviceErrorCode_t err )
```

Setter for [gErrorCode](#), previous values are unaffected.

### 5.2.4.12 AppCommon\_ResetErrorCode()

```
void AppCommon_ResetErrorCode ( )
```

Reset error Code.

## 5.14.2 Function Documentation

### 5.14.2.1 AppIndicate\_Init()

```
void AppIndicate_Init ( )
```

Wrapper around Indication medium initialization.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.14.2.2 AppIndicate\_DeInit()

```
void AppIndicate_DeInit ( )
```

Wrapper around Indication medium De-initialization.

Here is the call graph for this function:

### 5.14.2.3 AppIndicate\_SetState()

```
void AppIndicate_SetState (
    eAppIndicationStates_t state )
```

Set Indication medium state.

## Parameters

|                    |                                                                         |
|--------------------|-------------------------------------------------------------------------|
| <code>state</code> | Which application state to set to, <a href="#">gcAppIndicationTable</a> |

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.14.2.4 AppIndicate\_RevertState()

```
void AppIndicate_RevertState ( )
```

Revert to previous indication state. For preserving previous Indication state.

Here is the call graph for this function:

### 5.14.3 Variable Documentation

#### 5.14.3.1 gcAppIndicationTable

```
sTriColorIndication_t gcAppIndicationTable[eIND_MAX] [static]
```

Configuration table that determine how application states correspond to TriColor LED states.

#### 5.14.3.2 gCurrentState

```
eAppIndicationStates_t gCurrentState = eIND_NONE [static]
```

Current Indication state maintained in this global

#### 5.14.3.3 gPrevState

```
eAppIndicationStates_t gPrevState = eIND_NONE [static]
```

Previous Indication state maintained here

## 5.20.2 Function Documentation

### 5.20.2.1 TriColorLed\_ToggleState()

```
static void TriColorLed_ToggleState (
    volatile sTricolorLED_t *const pMe ) [static]
```

Toggle TriColor LED.

## Parameters

|            |                       |
|------------|-----------------------|
| <i>pMe</i> | TriColor LED instance |
|------------|-----------------------|

Here is the call graph for this function:

Here is the caller graph for this function:

## 5.20.2.2 TriColorLed\_GetInstance()

```
static volatile sTricolorLED_t *const TriColorLed_GetInstance ( ) [static]
```

Get tricolor LED instance.

## Returns

volatile\* const

Here is the caller graph for this function:

### 5.20.2.3 TriColorLED\_cbBlinkHandler()

```
static void TriColorLED_cbBlinkHandler ( ) [static]
```

Call back function registered with softtimer.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.20.2.4 TriColorLed\_SetState()

```
static void TriColorLed_SetState (
    volatile sTricolorLED_t *const pMe,
    eTriColorLEDStates_t triColorLEDState ) [static]
```

Set TriColor LED state.

#### Parameters

|                         |                       |
|-------------------------|-----------------------|
| <i>pMe</i>              | TriColor LED instance |
| <i>triColorLEDState</i> |                       |

< Set Primary set of LED

< Duplicate set of LED follows primary LED indicationHere is the caller graph for this function:

### 5.20.2.5 TriColorLed\_Init()

```
static void TriColorLed_Init (
    volatile sTricolorLED_t *const pMe ) [static]
```

Initialize Tricolor LED.

Parameters

|            |                       |
|------------|-----------------------|
| <i>pMe</i> | TriColor LED instance |
|------------|-----------------------|

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.20.2.6 TriColorLed\_DeInit()

```
static void TriColorLed_DeInit (
    volatile sTricolorLED_t *const pMe ) [static]
```

DeInitialize Tricolor LED.

Parameters

|            |                       |
|------------|-----------------------|
| <i>pMe</i> | TriColor LED instance |
|------------|-----------------------|

Here is the caller graph for this function:

### 5.20.2.7 TriColorLed\_StartBlink()

```

static void TriColorLed_StartBlink (
    volatile sTricolorLED_t *const pMe,
    eTriColorLEDBlinkPeriod_t eBlinkPeriod,
    bool IsStartNeeded ) [static]
  
```

Enable/Disable LED blink routine. The Blink will be executed though [TriColorLED\\_cbBlinkHandler](#).

#### Parameters

|                      |                                                  |
|----------------------|--------------------------------------------------|
| <i>pMe</i>           | TriColor LED instance                            |
| <i>eBlinkPeriod</i>  |                                                  |
| <i>IsStartNeeded</i> | Pass true if blink needed, false to cancel blink |

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.20.2.8 TriColorLed\_API\_Init()

```
void TriColorLed_API_Init ( )
```

Initialize tricolor LED API.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.20.2.9 TriColorLed\_API\_DeInit()

```
void TriColorLed_API_DeInit ( )
```

Deinitialize tricolor LED API.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.20.2.10 TriColorLed\_API\_SetState()

```
void TriColorLed_API_SetState (
    eTriColorLEDStates_t state )
```

API to set Tricolor LED state.

#### Parameters

|              |                           |
|--------------|---------------------------|
| <i>state</i> | state to set TriColor LED |
|--------------|---------------------------|

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.20.2.11 TriColorLed\_API\_Indicate()

```
void TriColorLed_API_Indicate (
    eTriColorLEDStates_t state,
    eTriColorLEDBlinkPeriod_t eBlinkPeriod,
    bool IsBlinkNeeded )
```

Tricolor LED to indicate various Application states.

#### Parameters

|                      |                                                                    |
|----------------------|--------------------------------------------------------------------|
| <i>state</i>         | TriColor LED color to set                                          |
| <i>eBlinkPeriod</i>  | Period to blink LED over                                           |
| <i>IsBlinkNeeded</i> | Set to true if blinking is needed, else the LED will only light up |

Here is the call graph for this function:

Here is the caller graph for this function:

## 5.20.3 Variable Documentation

### 5.20.3.1 gcLEDEnumtoGPIOStateConverter

```
const GPIO_PinState gcLEDEnumtoGPIOStateConverter[eLED_STATE_MAX] [static]
```

**Initial value:**

```
=
{
    [eLED_OFF] = GPIO_PIN_RESET,
    [eLED_ON] = GPIO_PIN_SET,
}
```

Helper table that maps LED state to GPIO state.

### 5.20.3.2 gcLEDPins

```
const sSTMGPIO_PinWrapper_t gcLEDPins[eLED_MAX] [static]
```

**Initial value:**

```
=
{
    [eLED_RED] = { .GpioPort = LED_R_GPIO_Port, .GpioPin = LED_R_Pin },
    [eLED_GREEN] = { .GpioPort = LED_G_GPIO_Port, .GpioPin = LED_G_Pin },
    [eLED_BLUE] = { .GpioPort = LED_B_GPIO_Port, .GpioPin = LED_B_Pin },
}
```

LED pin mapping helper table.

### 5.20.3.3 gcLEDPins2

```
const sSTMGpioPinWrapper_t gcLEDPins2[eLED_MAX] [static]
```

**Initial value:**

```
=
{
    [eLED_BLUE]      = { .GpioPort = LED_R1_GPIO_Port, .GpioPin = LED_R1_Pin },
    [eLED_GREEN]     = { .GpioPort = LED_G1_GPIO_Port, .GpioPin = LED_G1_Pin },
    [eLED_RED]       = { .GpioPort = LED_B1_GPIO_Port, .GpioPin = LED_B1_Pin },
}
```

LED pin mapping helper table.

- warning eLED\_BLUE and eLED\_RED are swapped in Rev 1A Hardware

### 5.20.3.4 gcLEDStateHelperTable

```
const sTriColorLEDState_t gcLEDStateHelperTable[eLED_COLOR_STATE_MAX] [static]
```

Helper structure to map TriColor LED enumerations to Individual LED combinations.

### 5.20.3.5 gcBlinkPeriodToCountHelper

```
const uint32_t gcBlinkPeriodToCountHelper[eLED_BLINK_PERIOD_MAX] [static]
```

**Initial value:**

```
=
{
    [eTRICOLORLED_BLINK_NONE]      = UINT32_MAX,
    [eTRICOLORLED_BLINK_250MS]     = 250/TRICOLOR_LED_BLINK_TIME_BASE_MS,
    [eTRICOLORLED_BLINK_500MS]     = 500/TRICOLOR_LED_BLINK_TIME_BASE_MS,
    [eTRICOLORLED_BLINK_1000MS]    = 1000/TRICOLOR_LED_BLINK_TIME_BASE_MS,
    [eTRICOLORLED_BLINK_2000MS]    = 2000/TRICOLOR_LED_BLINK_TIME_BASE_MS
}
```

Utility table that saves LED timings to ticks based on [TRICOLOR\\_LED\\_BLINK\\_TIME\\_BASE\\_MS](#).

### 5.20.3.6 gvTricolorLed

```
volatile sTriColorLED_t gvTricolorLed [static]
```

Tricolor LED instance.

## 5.21 TriColorLED.c File Reference

```
#include <assert.h>
#include "TriColorLED.h"
#include "SoftTimer.h"
```

### 5.21.2.1 TriColorLed\_ToggleState()

```
static void TriColorLed_ToggleState (
    volatile sTricolorLED\_t *const pMe ) [static]
```

Toggle TriColor LED.

**Parameters**

|            |                       |
|------------|-----------------------|
| <i>pMe</i> | TriColor LED instance |
|------------|-----------------------|

Here is the call graph for this function:

Here is the caller graph for this function:

**5.21.2.2 TriColorLed\_GetInstance()**

```
static volatile sTricolorLED_t *const TriColorLed_GetInstance ( ) [static]
```

Get tricolor LED instance.

**Returns**

volatile\* const

Here is the caller graph for this function:

### 5.21.2.3 TriColorLED\_cbBlinkHandler()

```
static void TriColorLED_cbBlinkHandler ( ) [static]
```

Call back function registered with softtimer.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.21.2.4 TriColorLed\_SetState()

```
static void TriColorLed_SetState (
    volatile sTriColorLED_t *const pMe,
    eTriColorLEDStates_t triColorLEDState ) [static]
```

Set TriColor LED state.

#### Parameters

|                         |                       |
|-------------------------|-----------------------|
| <i>pMe</i>              | TriColor LED instance |
| <i>triColorLEDState</i> |                       |

< Set Primary set of LED

< Duplicate set of LED follows primary LED indicationHere is the caller graph for this function:

### 5.21.2.5 TriColorLed\_Init()

```
static void TriColorLed_Init (
    volatile sTricolorLED_t *const pMe ) [static]
```

Initialize Tricolor LED.

#### Parameters

|            |                       |
|------------|-----------------------|
| <i>pMe</i> | TriColor LED instance |
|------------|-----------------------|

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.21.2.6 TriColorLed\_DeInit()

```
static void TriColorLed_DeInit (
    volatile sTricolorLED_t *const pMe ) [static]
```

Deinitialize Tricolor LED.

#### Parameters

|            |                       |
|------------|-----------------------|
| <i>pMe</i> | TriColor LED instance |
|------------|-----------------------|

Here is the caller graph for this function:

#### 5.21.2.7 TriColorLed\_StartBlink()

```
static void TriColorLed_StartBlink (
    volatile sTricolorLED_t *const pMe,
    eTriColorLEDBlinkPeriod_t eBlinkPeriod,
    bool IsStartNeeded ) [static]
```

Enable/Disable LED blink routine. The Blink will be executed though [TriColorLED\\_cbBlinkHandler](#).

##### Parameters

|                      |                                                  |
|----------------------|--------------------------------------------------|
| <i>pMe</i>           | TriColor LED instance                            |
| <i>eBlinkPeriod</i>  |                                                  |
| <i>IsStartNeeded</i> | Pass true if blink needed, false to cancel blink |

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.21.2.8 TriColorLed\_API\_Init()

```
void TriColorLed_API_Init ( )
```

Initialize tricolor LED API.

Here is the call graph for this function:

### 5.21.2.9 TriColorLed\_API\_DeInit()

```
void TriColorLed_API_DeInit ( )
```

Deinitialize tricolor LED API.

Here is the call graph for this function:

### 5.21.2.10 TriColorLed\_API\_SetState()

```
void TriColorLed_API_SetState (
    eTriColorLEDStates_t state )
```

API to set Tricolor LED state.

Parameters

|              |                           |
|--------------|---------------------------|
| <i>state</i> | state to set TriColor LED |
|--------------|---------------------------|

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.21.2.11 TriColorLed\_API\_Indicate()

```
void TriColorLed_API_Indicate (
    eTriColorLEDStates_t state,
    eTriColorLEDBlinkPeriod_t eBlinkPeriod,
    bool IsBlinkNeeded )
```

Tricolor LED to indicate various Application states.

##### Parameters

|                      |                                                                    |
|----------------------|--------------------------------------------------------------------|
| <i>state</i>         | TriColor LED color to set                                          |
| <i>eBlinkPeriod</i>  | Period to blink LED over                                           |
| <i>IsBlinkNeeded</i> | Set to true if blinking is needed, else the LED will only light up |

Here is the call graph for this function:

### 5.21.3 Variable Documentation

#### 5.21.3.1 gcLEDEnumtoGPIOStateConverter

```
const GPIO_PinState gcLEDEnumtoGPIOStateConverter[eLED_STATE_MAX] [static]
```

**Initial value:**

```
=
{
    [eLED_OFF] = GPIO_PIN_RESET,
    [eLED_ON] = GPIO_PIN_SET,
}
```

Helper table that maps LED state to GPIO state.

#### 5.21.3.2 gcLEDPins

```
const sLEDPins_t gcLEDPins[eLED_MAX] [static]
```

**Initial value:**

```
=
{
    [eLED_RED]      = { .LEDPort = LED_R_GPIO_Port, .LEDPin = LED_R_Pin },
    [eLED_GREEN]    = { .LEDPort = LED_G_GPIO_Port, .LEDPin = LED_G_Pin },
    [eLED_BLUE]     = { .LEDPort = LED_B_GPIO_Port, .LEDPin = LED_B_Pin },
}
```

LED pin mapping helper table.

#### 5.21.3.3 gcLEDPins2

```
const sLEDPins_t gcLEDPins2[eLED_MAX] [static]
```

**Initial value:**

```
=
{
    [eLED_BLUE]     = { .LEDPort = LED_R1_GPIO_Port, .LEDPin = LED_R1_Pin },
    [eLED_GREEN]    = { .LEDPort = LED_G1_GPIO_Port, .LEDPin = LED_G1_Pin },
    [eLED_RED]      = { .LEDPort = LED_B1_GPIO_Port, .LEDPin = LED_B1_Pin },
}
```

LED pin mapping helper table.

- warning eLED\_BLUE and eLED\_RED are swapped in Rev 1A Hardware

### 5.21.3.4 gcLEDStateHelperTable

```
const sTriColorLEDState_t gcLEDStateHelperTable[eLED_COLOR_STATE_MAX] [static]
```

Helper structure to map TriColor LED enumerations to Individual LED combinations.

### 5.21.3.5 gcBlinkPeriodToCountHelper

```
const uint32_t gcBlinkPeriodToCountHelper[eLED_BLINK_PERIOD_MAX] [static]
```

**Initial value:**

```
=
{
    [eTRICOLORLED_BLINK_NONE]          = UINT32_MAX,
    [eTRICOLORLED_BLINK_250MS]         = 250/TRICOLOR_LED_BLINK_TIME_BASE_MS,
    [eTRICOLORLED_BLINK_500MS]         = 500/TRICOLOR_LED_BLINK_TIME_BASE_MS,
    [eTRICOLORLED_BLINK_1000MS]        = 1000/TRICOLOR_LED_BLINK_TIME_BASE_MS,
    [eTRICOLORLED_BLINK_2000MS]        = 2000/TRICOLOR_LED_BLINK_TIME_BASE_MS
}
```

Utility table that saves LED timings to ticks based on [TRICOLOR\\_LED\\_BLINK\\_TIME\\_BASE\\_MS](#).

### 5.21.3.6 gvTricolorLed

```
volatile sTricolorLED_t gvTricolorLed [static]
```

Tricolor LED instance.

## 5.22 TriColorLED.h File Reference

```
#include <stdbool.h>
#include <stdint.h>
#include "gpio.h"
#include "CommonDefinitions.h"
```

### 5.22.2 Enumeration Type Documentation

#### 5.22.2.1 eLEDId\_t

enum [eLEDId\\_t](#)

LEDs that make up tricolor LEDs.

### 5.22.2.2 eLEDState\_t

```
enum eLEDState_t
```

LED state enumeration.

### 5.22.2.3 eTriColorLEDBlinkPeriod\_t

```
enum eTriColorLEDBlinkPeriod_t
```

Possible LED blink periods.

### 5.22.2.4 eTriColorLEDStates\_t

```
enum eTriColorLEDStates_t
```

TriColor LED state enumerations.

## 5.22.3 Function Documentation

### 5.22.3.1 TriColorLed\_API\_Init()

```
void TriColorLed_API_Init ( )
```

Initialize tricolor LED API.

### 5.22.3.2 TriColorLed\_API\_DeInit()

```
void TriColorLed_API_DeInit ( )
```

DeInitialize tricolor LED API.

### 5.22.3.3 TriColorLed\_API\_SetState()

```
void TriColorLed_API_SetState (
    eTriColorLEDStates_t state )
```

API to set Tricolor LED state.

#### Parameters

|              |                           |
|--------------|---------------------------|
| <i>state</i> | state to set TriColor LED |
|--------------|---------------------------|

### 5.22.3.4 TriColorLed\_API\_Indicate()

```
void TriColorLed_API_Indicate (
    eTriColorLEDStates_t state,
    eTriColorLEDBlinkPeriod_t eBlinkPeriod,
    bool IsBlinkNeeded )
```

Tricolor LED to indicate various Application states.

#### Parameters

|                      |                                                                    |
|----------------------|--------------------------------------------------------------------|
| <i>state</i>         | TriColor LED color to set                                          |
| <i>eBlinkPeriod</i>  | Period to blink LED over                                           |
| <i>IsBlinkNeeded</i> | Set to true if blinking is needed, else the LED will only light up |

### 5.24.2 Enumeration Type Documentation

#### 5.24.2.1 eLEDId\_t

enum [eLEDId\\_t](#)

LEDs that make up tricolor LEDs.

### 5.24.2.2 eLEDState\_t

```
enum eLEDState_t
```

LED state enumeration.

### 5.24.2.3 eTriColorLEDBlinkPeriod\_t

```
enum eTriColorLEDBlinkPeriod_t
```

Possible LED blink periods.

### 5.24.2.4 eTriColorLEDStates\_t

```
enum eTriColorLEDStates_t
```

TriColor LED state enumerations.

## 5.24.3 Function Documentation

### 5.24.3.1 TriColorLed\_API\_Init()

```
void TriColorLed_API_Init ( )
```

Initialize tricolor LED API.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.24.3.2 TriColorLed\_API\_DeInit()

```
void TriColorLed_API_DeInit ( )
```

DeInitialize tricolor LED API.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.24.3.3 TriColorLed\_API\_SetState()

```
void TriColorLed_API_SetState (
    eTriColorLEDStates_t state )
```

API to set Tricolor LED state.

#### Parameters

|              |                           |
|--------------|---------------------------|
| <i>state</i> | state to set TriColor LED |
|--------------|---------------------------|

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.24.3.4 TriColorLed\_API\_Indicate()

```

void TriColorLed_API_Indicate (
    eTriColorLEDStates_t state,
    eTriColorLEDBlinkPeriod_t eBlinkPeriod,
    bool IsBlinkNeeded )
  
```

Tricolor LED to indicate various Application states.

##### Parameters

|                      |                                                                    |
|----------------------|--------------------------------------------------------------------|
| <i>state</i>         | TriColor LED color to set                                          |
| <i>eBlinkPeriod</i>  | Period to blink LED over                                           |
| <i>IsBlinkNeeded</i> | Set to true if blinking is needed, else the LED will only light up |

### 5.33.2 Function Documentation

#### 5.33.2.1 [SoftTimer\\_cbPeriodicCheck](#)()

```
void SoftTimer_cbPeriodicCheck ( )
```

Periodic call from soft-timer that checks if any registered timers have expired and invokes the registered call back [HAL\\_TIM\\_PeriodElapsedCallback](#).

Here is the caller graph for this function:

### 5.33.2.2 SoftTimer\_DefaultCallbackFunction()

```
static void SoftTimer_DefaultCallbackFunction ( ) [static]
```

Default call back for soft-timers without any executors.

Here is the caller graph for this function:

### 5.33.2.3 SoftTimer\_GetSoftTimerBaseOverFlowPeriodMS()

```
static uint32_t SoftTimer_GetSoftTimerBaseOverFlowPeriodMS ( ) [inline], [static]
```

Automatically determine the software overflow period from timer instance.

#### Note

Designed for 10ms for the current clock tree

Here is the caller graph for this function:

### 5.33.2.4 SoftTimer\_timeToTicks()

```
static uint32_t SoftTimer_timeToTicks (
    uint32_t timeMs ) [static]
```

Utility function to convert timeinMS to soft-timer ticks count.

#### Parameters

|               |  |
|---------------|--|
| <i>timeMs</i> |  |
|---------------|--|

#### Returns

uint32\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.33.2.5 SoftTimer\_Init()

```
void SoftTimer_Init ( )
```

Initialize soft-timer.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.33.2.6 `__attribute__()`

```
__attribute__ (
    (unused) )
```

Get time left for expiry.

#### Parameters

|           |                  |
|-----------|------------------|
| <i>id</i> | ID of soft-timer |
|-----------|------------------|

#### Returns

uint32\_t time left for soft-timer expire in ms

Here is the call graph for this function:

### 5.33.2.7 `SoftTimer_DeInit()`

```
void SoftTimer_DeInit ( )
```

Deinitialize soft-timer.

### 5.33.2.8 `SoftTimer_Register()`

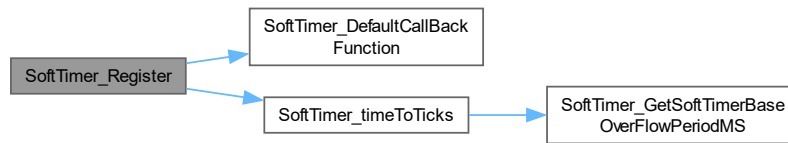

```
void SoftTimer_Register (
    eSoftTimerID_t id,
    uint32_t timeout,
    bool IsPeriodic,
    pfCallBack_t callbackFunction )
```

Register a periodic function with soft-timer, create ID under eSoftTimerID and attach call-back and time period through this function.

#### Parameters

|                         |  |
|-------------------------|--|
| <i>id</i>               |  |
| <i>timeout</i>          |  |
| <i>IsPeriodic</i>       |  |
| <i>callbackFunction</i> |  |

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.33.2.9 SoftTimer\_Start()

```

void SoftTimer_Start (
    eSoftTimerID_t id,
    bool IsStartNeeded )
  
```

Start soft-timer.

#### Parameters

|                      |  |
|----------------------|--|
| <i>id</i>            |  |
| <i>IsStartNeeded</i> |  |

Here is the caller graph for this function:

### 5.33.2.10 SoftTimer\_Pause()

```

void SoftTimer_Pause (
  
```

```
eSoftTimerID_t id,  
bool IsPauseNeeded )
```

Function to disable and enable soft-timer for creating critical sections.

#### Parameters

|                      |                                      |
|----------------------|--------------------------------------|
| <i>id</i>            | ID of the soft-timer to pause/resume |
| <i>IsPauseNeeded</i> | Pause if true, resume if false       |

#### 5.33.2.11 SoftTimer\_StartAll()

```
void SoftTimer_StartAll (  
    bool IsStartNeeded )
```

Collectively start all registered soft-timers.

#### Parameters

|                      |  |
|----------------------|--|
| <i>IsStartNeeded</i> |  |
|----------------------|--|

Here is the call graph for this function:

#### 5.33.2.12 SofTimer\_IsExpired()

```
bool SofTimer_IsExpired (  
    eSoftTimerID_t id )
```

Check if soft-timers has expired.

#### Parameters

|           |                                |
|-----------|--------------------------------|
| <i>id</i> | id of soft-timer to be checked |
|-----------|--------------------------------|

#### Returns

true if soft-timer has expired  
false if V has not expired / has not been enabled

Here is the caller graph for this function:

### 5.33.2.13 SoftTimer\_AperiodicTimerSet()

```
void SoftTimer_AperiodicTimerSet (
    uint32_t timeout )
```

Set Aperiodic timer instance useful for setting timeouts.

#### Note

eGENERIC\_COUNT\_DOWN\_TIMER must not be used for other periodic timers

#### Parameters

|                |                                     |
|----------------|-------------------------------------|
| <i>timeout</i> | time out to set the aperiodic timer |
|----------------|-------------------------------------|

Here is the call graph for this function:

### 5.33.2.14 SoftTimer\_HasAperiodicTimerExpired()

```
bool SoftTimer_HasAperiodicTimerExpired ( )
```

Check if aperiodic timer has expired.

**Returns**

true if timer has expired  
false if timer has not expired/ Registered / started

Here is the call graph for this function:

**5.33.2.15 SoftTimer\_DelayMS()**

```
void SoftTimer_DelayMS (  
    uint32_t delayMS )
```

Wrapper around HAL\_Delay delay.

**Parameters**

|                |                    |
|----------------|--------------------|
| <i>delayMS</i> | delay needed in mS |
|----------------|--------------------|

Here is the caller graph for this function:

**5.33.2.16 SoftTimer\_GetCurrentMSTick()**

```
uint32_t SoftTimer_GetCurrentMSTick ( )
```

Wrapper around HAL tick count.

**Returns**

tick count from HAL

### 5.33.3 Variable Documentation

#### 5.33.3.1 gvSoftTimers

```
volatile sSoftTimer\_t gvSoftTimers[eSOFT_TIMER_MAX] [static]
```

All soft-timer instances are captured here.

## 5.34 SoftTimer.h File Reference

```
#include <stdint.h>
#include <stdbool.h>
#include "tim.h"
```

### Data Structures

- struct [sSoftTimer\\_t](#)

### Macros

- #define **SOFTTIMER\_TIMER\_INSTANCE** (&htim6)

### 5.34.2 Enumeration Type Documentation

#### 5.34.2.1 eSoftTimerID\_t

```
enum eSoftTimerID_t
```

soft-timer IDs

### 5.34.3 Function Documentation

#### 5.34.3.1 SoftTimer\_Register()

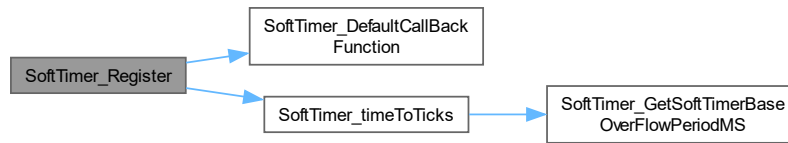

```
void SoftTimer_Register (
    eSoftTimerID_t id,
    uint32_t timeout,
    bool IsPeriodic,
    pfCallBack_t callbackFunction )
```

Register a periodic function with soft-timer, create ID under eSoftTimerID and attach call-back and time period through this function.

#### Parameters

|                         |  |
|-------------------------|--|
| <i>id</i>               |  |
| <i>timeout</i>          |  |
| <i>IsPeriodic</i>       |  |
| <i>callbackFunction</i> |  |

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.34.3.2 SoftTimer\_Init()

```
void SoftTimer_Init ( )
```

Initialize soft-timer.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.34.3.3 SoftTimer\_DeInit()

```
void SoftTimer_DeInit ( )
```

Deinitialize soft-timer.

### 5.34.3.4 SoftTimer\_Start()

```
void SoftTimer_Start (
    eSoftTimerID_t id,
    bool IsStartNeeded )
```

Start soft-timer.

#### Parameters

|                      |  |
|----------------------|--|
| <i>id</i>            |  |
| <i>IsStartNeeded</i> |  |

Here is the caller graph for this function:

### 5.34.3.5 SoftTimer\_Pause()

```
void SoftTimer_Pause (
    eSoftTimerID_t id,
    bool IsPauseNeeded )
```

Function to disable and enable soft-timer for creating critical sections.

#### Parameters

|                      |                                      |
|----------------------|--------------------------------------|
| <i>id</i>            | ID of the soft-timer to pause/resume |
| <i>IsPauseNeeded</i> | Pause if true, resume if false       |

### 5.34.3.6 SoftTimer\_AperiodicTimerSet()

```
void SoftTimer_AperiodicTimerSet (
```

```
uint32_t timeout )
```

Set Aperiodic timer instance useful for setting timeouts.

#### Note

eGENERIC\_COUNT\_DOWN\_TIMER must not be used for other periodic timers

#### Parameters

|                |                                     |
|----------------|-------------------------------------|
| <i>timeout</i> | time out to set the aperiodic timer |
|----------------|-------------------------------------|

Here is the call graph for this function:

#### 5.34.3.7 SoftTimer\_DelayMS()

```
void SoftTimer_DelayMS (
    uint32_t delayMS )
```

Wrapper around HAL\_Delay delay.

#### Parameters

|                |                    |
|----------------|--------------------|
| <i>delayMS</i> | delay needed in mS |
|----------------|--------------------|

Here is the caller graph for this function:

#### 5.34.3.8 SoftTimer\_cbPeriodicCheck()

```
void SoftTimer_cbPeriodicCheck ( )
```

Periodic call from soft-timer that checks if any registered timers have expired and invokes the registered call back [HAL\\_TIM\\_PeriodElapsedCallback](#).

Here is the caller graph for this function:

#### 5.34.3.9 SofTimer\_IsExpired()

```
bool SofTimer_IsExpired (
    eSoftTimerID_t id )
```

Check if soft-timers has expired.

##### Parameters

|           |                                |
|-----------|--------------------------------|
| <i>id</i> | id of soft-timer to be checked |
|-----------|--------------------------------|

##### Returns

true if soft-timer has expired  
false if V has not expired / has not been enabled

Here is the caller graph for this function:

#### 5.34.3.10 SoftTimer\_HasAperiodicTimerExpired()

```
bool SoftTimer_HasAperiodicTimerExpired ( )
```

Check if aperiodic timer has expired.

**Returns**

true if timer has expired  
false if timer has not expired/ Registered / started

Here is the call graph for this function:

**5.34.3.11 SoftTimer\_GetCurrentMSTick()**

```
uint32_t SoftTimer_GetCurrentMSTick ( )
```

Wrapper around HAL tick count.

**Returns**

tick count from HAL

**5.35 SoftTimer.h**

### 5.40.2 Function Documentation

#### 5.40.2.1 HAL\_UART\_RxCpltCallback()

```
void HAL_UART_RxCpltCallback (
    UART_HandleTypeDef * huart )
```

STM HAL reception callback.

**Parameters**

|              |  |
|--------------|--|
| <i>huart</i> |  |
|--------------|--|

Here is the call graph for this function:

#### 5.40.2.2 HAL\_TIM\_PeriodElapsedCallback()

```
void HAL_TIM_PeriodElapsedCallback (
    TIM_HandleTypeDef * htim )
```

Timer callback associated with soft-timer, part of STM HAL.

**Parameters**

|             |                |
|-------------|----------------|
| <i>htim</i> | timer instance |
|-------------|----------------|

Here is the call graph for this function:

## 5.45.2 Function Documentation

### 5.45.2.1 Console\_cbCommandReceived()

```
void Console_cbCommandReceived ( )
```

Call back function invoked by [HAL\\_UART\\_RxCpltCallback](#) upon receiving CONSOLE\_COMMAND\_TOKEN\_SIZE characters.

#### Note

CONSOLE\_COMMAND\_TOKEN\_SIZE is set to `strlen(gConsoleCommandHelperTable[eCONSOLE_LEVEL2_ENABLE].CommandStr)` when expecting Secret key for level 2 logs

< Check if required passkey is received, if not continue to listen on the console RxHere is the call graph for this function:

Here is the caller graph for this function:

### 5.45.2.2 Console\_Init()

```
void Console_Init ( )
```

Initialize console.

Here is the caller graph for this function:

### 5.45.2.3 Console\_DeInit()

```
void Console_DeInit ( )
```

Deinitialize console.

### 5.45.2.4 Console\_TransmitChar()

```
eConsolePrintStatus_t Console_TransmitChar (
    uint8_t data )
```

Transmit character over Console.

#### Parameters

|             |                        |
|-------------|------------------------|
| <i>data</i> | char to be transmitted |
|-------------|------------------------|

#### Returns

eConsoleStatus\_t

Here is the caller graph for this function:

### 5.45.2.5 Console\_Print()

```
eConsolePrintStatus_t Console_Print (
    eConsolePrintLevel_t currentLevel,
    char * format,
    ... )
```

Console print function.

#### Parameters

|                     |                                   |
|---------------------|-----------------------------------|
| <i>currentLevel</i> | : What level to print the logs in |
| <i>format</i>       | format string                     |
| ...                 |                                   |

**Returns**

eConsolePrintStatus\_t

&lt; not supported in this Hardware

< For print to get through, print level should be sufficient, Hardware override works on levels below eCONSOLE↔  
 \_PRINT\_LVL2Here is the caller graph for this function:

**5.45.2.6 Console\_receive()**

```

eConsolePrintStatus_t Console_receive (
    uint8_t * pOutdata,
    uint16_t length )

```

Receive data over console.

**Parameters**

|                 |                             |
|-----------------|-----------------------------|
| <i>pOutdata</i> | Received data is saved here |
| <i>length</i>   | Size of data read           |

**Returns**

eConsoleStatus\_t

Here is the caller graph for this function:

#### 5.45.2.7 Console\_PrintProgressBar()

```
void Console_PrintProgressBar ( )
```

Thin wrapper around UART transmit for Progress Bar print on console.

Here is the caller graph for this function:

#### 5.45.2.8 Console\_IsCommandRaised()

```
bool Console_IsCommandRaised (
    eConsoleCommandsEnum_t cmd )
```

Utility function to check if any command request has been made.

##### Parameters

|            |  |
|------------|--|
| <i>cmd</i> |  |
|------------|--|

##### Returns

true  
false

#### 5.45.2.9 Console\_RaiseConsoleCmdRequest()

```
void Console_RaiseConsoleCmdRequest (
    eConsoleCommandsEnum_t cmd )
```

Raise a request to process a console command.

Here is the caller graph for this function:

#### 5.45.2.10 Console\_Sync()

```
void Console_Sync ( )
```

Deferred processing of commands received over console.

### 5.45.3 Variable Documentation

#### 5.45.3.1 gDataBuffer

```
char gDataBuffer[CONSOLE_BUFFER_SIZE] = {0} [static]
```

Global buffer used by Console print

#### 5.45.3.2 gConsoleCommandHelperTable

```
sConsoleCommand_t gConsoleCommandHelperTable[eCONSOLE_MAX_COMMANDS] [static]
```

**Initial value:**

```
=
{
}
```

Console commands, names and their flags are stored in this table.

#### 5.45.3.3 gvElevatedPromptData

```
volatile sElevatedPromptData_t gvElevatedPromptData = {.buf = {0}} [static]
```

Buffer for saving elevated prompt data

### 5.46.2 Function Documentation

#### 5.46.2.1 Console\_cbCommandReceived()

```
void Console_cbCommandReceived ( )
```

Call back function invoked by [HAL\\_UART\\_RxCpltCallback](#) upon receiving CONSOLE\_COMMAND\_TOKEN\_SIZE characters.

**Note**

CONSOLE\_COMMAND\_TOKEN\_SIZE is set to strlen(gConsoleCommandHelperTable[eCONSOLE\_↔  
LEVEL2\_ENABLE].CommandStr) when expecting Secret key for level 2 logs

< Check if required pass-key is received, if not continue to listen on the console RxHere is the call graph for this function:

**5.46.2.2 Console\_Init()**

```
void Console_Init ( )
```

Initialize console.

**5.46.2.3 Console\_DeInit()**

```
void Console_DeInit ( )
```

DeInitialize console.

**5.46.2.4 Console\_TransmitChar()**

```
eConsolePrintStatus_t Console_TransmitChar (
    uint8_t data )
```

Transmit character over Console.

**Parameters**

|             |                        |
|-------------|------------------------|
| <i>data</i> | char to be transmitted |
|-------------|------------------------|

**Returns**

eConsoleStatus\_t

< Make available the UART module.

**5.46.2.5 Console\_Print()**

```
eConsolePrintStatus_t Console_Print (
    eConsolePrintLevel_t currentLevel,
```

```
char * format,
... )
```

Console print function.

#### Parameters

|                     |                                   |
|---------------------|-----------------------------------|
| <i>currentLevel</i> | : What level to print the logs in |
| <i>format</i>       | format string                     |
| ...                 |                                   |

#### Returns

eConsolePrintStatus\_t

< not supported in this Hardware

< For print to get through, print level should be sufficient, Hardware override works on levels below eCONSOLE↔  
\_PRINT\_LVL2Here is the caller graph for this function:

#### 5.46.2.6 Console\_receive()

```
eConsolePrintStatus_t Console_receive (
    uint8_t * pOutdata,
    uint16_t length )
```

Receive data over console.

#### Parameters

|                 |                             |
|-----------------|-----------------------------|
| <i>pOutdata</i> | Received data is saved here |
| <i>length</i>   | Size of data read           |

#### Returns

eConsoleStatus\_t

< Make available the UART module.

#### 5.46.2.7 Console\_PrintProgressBar()

```
void Console_PrintProgressBar ( )
```

Thin wrapper around UART transmit for Progress Bar print on console.

#### 5.46.2.8 Console\_PrintLineBreak()

```
void Console_PrintLineBreak ( )
```

Utility function to print delimiter used in the console.

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.46.2.9 Console\_PrintDelimiter()

```
void Console_PrintDelimiter ( )
```

Utility function to print delimiter used in the console.

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.46.2.10 Console\_IsCommandRaised()

```
bool Console_IsCommandRaised (
    eConsoleCommandsEnum_t cmd )
```

Utility function to check if any command request has been made.

##### Parameters

|            |  |
|------------|--|
| <i>cmd</i> |  |
|------------|--|

##### Returns

true

false

#### 5.46.2.11 Console\_RaiseConsoleCmdRequest()

```
void Console_RaiseConsoleCmdRequest (
    eConsoleCommandsEnum_t cmd )
```

Raise a request to process a console command.

Here is the caller graph for this function:

#### 5.46.2.12 Console\_Sync()

```
void Console_Sync ( )
```

Deferred processing of commands received over console.

### 5.46.3 Variable Documentation

#### 5.46.3.1 gConsoleCommandHelperTable

```
sConsoleCommand_t gConsoleCommandHelperTable[eCONSOLE_MAX_COMMANDS] = {} [static]
```

Console commands, names and their flags are stored in this table.

## 5.47 Console.h File Reference

```
#include <stdbool.h>
#include "Utility.h"
```

### 5.47.2 Macro Definition Documentation

#### 5.47.2.1 `CONSOLE_BUFFER_SIZE`

```
#define CONSOLE_BUFFER_SIZE (512u)
```

Console buffer size, To be increased if larger strings are to be printed.

Maximum expected response is just under 200 bytes

### 5.47.3 Typedef Documentation

#### 5.47.3.1 `pfConsoleCommandActor_t`

```
typedef void(* pfConsoleCommandActor_t) (void)
```

Console command handlers.

### 5.47.4 Enumeration Type Documentation

#### 5.47.4.1 `eConsolePrintStatus_t`

```
enum eConsolePrintStatus_t
```

Enum that maintains Console status.

#### 5.47.4.2 `eConsoleCommandsEnum_t`

```
enum eConsoleCommandsEnum_t
```

Command names are enumerated here.

#### 5.47.4.3 eConsolePrintLevel\_t

```
enum eConsolePrintLevel_t
```

Console print level.

### 5.47.5 Function Documentation

#### 5.47.5.1 Console\_Init()

```
void Console_Init ( )
```

Initialize console.

#### 5.47.5.2 Console\_DeInit()

```
void Console_DeInit ( )
```

DeInitialize console.

#### 5.47.5.3 Console\_TransmitChar()

```
eConsolePrintStatus_t Console_TransmitChar (
    uint8_t data )
```

Transmit character over Console.

##### Parameters

|             |                        |
|-------------|------------------------|
| <i>data</i> | char to be transmitted |
|-------------|------------------------|

##### Returns

eConsoleStatus\_t

< Make available the UART module.

#### 5.47.5.4 Console\_Print()

```
eConsolePrintStatus_t Console_Print (
    eConsolePrintLevel_t currentLevel,
    char * format,
    ... )
```

Console print function.

**Parameters**

|                     |                                   |
|---------------------|-----------------------------------|
| <i>currentLevel</i> | : What level to print the logs in |
| <i>format</i>       | format string                     |
| ...                 |                                   |

**Returns**

eConsolePrintStatus\_t

**Parameters**

|                     |                                   |
|---------------------|-----------------------------------|
| <i>currentLevel</i> | : What level to print the logs in |
| <i>format</i>       | format string                     |
| ...                 |                                   |

**Returns**

eConsolePrintStatus\_t

< not supported in this Hardware

< For print to get through, print level should be sufficient, Hardware override works on levels below eCONSOLE↵\_PRINT\_LVL2

< not supported in this Hardware

< For print to get through, print level should be sufficient, Hardware override works on levels below eCONSOLE↵\_PRINT\_LVL2

**5.47.5.5 Console\_receive()**

```
eConsolePrintStatus_t Console_receive (
    uint8_t * pOutdata,
    uint16_t length )
```

Receive data over console.

**Parameters**

|                 |                             |
|-----------------|-----------------------------|
| <i>pOutdata</i> | Received data is saved here |
| <i>length</i>   | Size of data read           |

**Returns**

eConsoleStatus\_t

< Make available the UART module.

#### 5.47.5.6 Console\_cbCommandReceived()

```
void Console_cbCommandReceived ( )
```

Call back function invoked by [HAL\\_UART\\_RxCpltCallback](#) upon receiving CONSOLE\_COMMAND\_TOKEN\_SIZE characters.

##### Note

CONSOLE\_COMMAND\_TOKEN\_SIZE is set to strlen(gConsoleCommandHelperTable[eCONSOLE\_↵  
LEVEL2\_ENABLE].CommandStr) when expecting Secret key for level 2 logs

< Check if required passkey is received, if not continue to listen on the console Rx

< Check if required pass-key is received, if not continue to listen on the console Rx

#### 5.47.5.7 Console\_IsCommandRaised()

```
bool Console_IsCommandRaised (
    eConsoleCommandsEnum_t cmd )
```

Utility function to check if any command request has been made.

##### Parameters

|            |  |
|------------|--|
| <i>cmd</i> |  |
|------------|--|

##### Returns

true

false

##### Parameters

|            |  |
|------------|--|
| <i>cmd</i> |  |
|------------|--|

##### Returns

true

false

#### 5.47.5.8 Console\_RaiseConsoleCmdRequest()

```
void Console_RaiseConsoleCmdRequest (
    eConsoleCommandsEnum_t cmd )
```

Raise a request to process a console command.

### 5.47.5.9 Console\_Sync()

```
void Console_Sync ( )
```

Deferred processing of commands received over console.

### 5.47.5.10 Console\_PrintProgressBar()

```
void Console_PrintProgressBar ( )
```

Thin wrapper around UART transmit for Progress Bar print on console.

### 5.54.2.1 AppFasal\_Init()

```
static void AppFasal_Init ( ) [static]
```

Initialize all Application modules here.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.54.2.2 AppFasal\_StartUpMessagePrint()

```
static void AppFasal_StartUpMessagePrint ( ) [static]
```

Start up message print.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.54.2.3 AppFasal\_Run()

```
eAppFasalStates_t AppFasal_Run ( )
```

Application Run.

**Returns**

`eAppFasalStates_t`

< Set power to External Flash prior to Initializing the same

< Stop powering the external flash since transfer operation is complete

< Errors from previous run if any must be cleared hereHere is the call graph for this function:

### 5.54.3 Variable Documentation

### 5.54.3.1 gcIndicationToAppStateMap

```
const eAppIndicationStates_t gcIndicationToAppStateMap[eAPP_MAX_STATE] [static]
```

**Initial value:**

```

{
[eAPP_INIT] = eIND_BLUE_0,
[eAPP_STARTUP_MSG] = eIND_BLUE_250MS,
[eAPP_BUTTON_WAIT] = eIND_BLUE_500MS,

## 5.57.2 Function Documentation

### 5.57.2.1 AppCommon\_GetErrorCode()

```
eDeviceErrorCode_t AppCommon_GetErrorCode ( )
```

Setter for [gErrorCode](#), previous values are unaffected.

#### Returns

eDeviceErrorCode\_t

### 5.57.2.2 AppCommon\_AccumlateErrorCode()

```
void AppCommon_AccumlateErrorCode (
    eDeviceErrorCode_t err )
```

Setter for [gErrorCode](#), previous values are unaffected.

### 5.57.2.3 AppCommon\_ResetErrorCode()

```
void AppCommon_ResetErrorCode ( )
```

Reset error Code.

### 5.57.2.4 AppCommon\_GetStatusString()

```
const char *const AppCommon_GetStatusString (
    int status )
```

Utility function returns "Success" or "failure" based on status code passed.

## 5.60.2 Function Documentation

### 5.60.2.1 xmodem\_computeCRC()

```
static uint16_t xmodem_computeCRC (  
    uint8_t * data,  
    uint16_t length ) [static]
```

Calculates the CRC-16 for the input package.

#### Parameters

|               |                                               |
|---------------|-----------------------------------------------|
| <i>*data</i>  | Array of the data which we want to calculate. |
| <i>length</i> | Size of the data, either 128 or 1024 bytes.   |

**Returns**

status: The calculated CRC.

Here is the caller graph for this function:

**5.60.2.2 xmodem\_handlePacket()**

```
static xmodem_status xmodem_handlePacket (
    uint8_t header ) [static]
```

This function handles the data packet we get from the xmodem protocol.

**Parameters**

|               |             |
|---------------|-------------|
| <i>header</i> | SOH or STX. |
|---------------|-------------|

**Returns**

status: Report about the packet.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.60.2.3 xmodem\_errorHandler()

```
static xmodem_status xmodem_errorHandler (
    uint8_t * error_number,
    uint8_t max_error_number ) [static]
```

Handles the xmodem error. Raises the error counter, then if the number of the errors reached critical, do a graceful abort, otherwise send a NAK.

#### Parameters

|                         |                                                 |
|-------------------------|-------------------------------------------------|
| <i>*error_number</i>    | Number of current errors (passed as a pointer). |
| <i>max_error_number</i> | Maximal allowed number of errors.               |

#### Returns

status: X\_ERROR in case of too many errors, X\_OK otherwise.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.60.2.4 xmodem\_API\_receive()

```
xmodem_status xmodem_API_receive (
    void )
```

This function is the base of the Xmodem protocol. When we receive a header from UART, it decides what action it shall take.

## Parameters

|             |  |
|-------------|--|
| <i>void</i> |  |
|-------------|--|

## Returns

xmodem\_status

Here is the call graph for this function:

Here is the caller graph for this function:

## 5.61.2 Function Documentation

### 5.61.2.1 `xmodem_computeCRC()`

```
static uint16_t xmodem_computeCRC (  
    uint8_t * data,  
    uint16_t length ) [static]
```

Calculates the CRC-16 for the input package.

#### Parameters

|               |                                               |
|---------------|-----------------------------------------------|
| <i>*data</i>  | Array of the data which we want to calculate. |
| <i>length</i> | Size of the data, either 128 or 1024 bytes.   |

**Returns**

status: The calculated CRC.

Here is the caller graph for this function:

**5.61.2.2 xmodem\_handlePacket()**

```
static xmodem_status xmodem_handlePacket (  
    uint8_t header ) [static]
```

This function handles the data packet we get from the xmodem protocol.

**Parameters**

|               |             |
|---------------|-------------|
| <i>header</i> | SOH or STX. |
|---------------|-------------|

**Returns**

status: Report about the packet.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.61.2.3 xmodem\_errorHandler()

```

static xmodem_status xmodem_errorHandler (
    uint8_t * error_number,
    uint8_t max_error_number ) [static]
  
```

Handles the xmodem error. Raises the error counter, then if the number of the errors reached critical, do a graceful abort, otherwise send a NAK.

#### Parameters

|                         |                                                 |
|-------------------------|-------------------------------------------------|
| <i>*error_number</i>    | Number of current errors (passed as a pointer). |
| <i>max_error_number</i> | Maximal allowed number of errors.               |

#### Returns

status: X\_ERROR in case of too many errors, X\_OK otherwise.

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.61.2.4 xmodem\_API\_receive()

```
xmodem_status xmodem_API_receive (
    void )
```

This function is the base of the Xmodem protocol. When we receive a header from UART, it decides what action it shall take.

#### Parameters

|             |  |
|-------------|--|
| <i>void</i> |  |
|-------------|--|

#### Returns

xmodem\_status

Here is the call graph for this function:

## 5.61.3 Variable Documentation

### 5.61.3.1 gxModemPacketNumber

```
uint8_t gxModemPacketNumber = 1u [static]
```

Packet number counter.

### 5.61.3.2 gxModemIsFirstPacket

```
uint8_t gxModemIsFirstPacket = false [static]
```

First packet or not.

## 5.62 xmodem.h File Reference

```
#include "stdbool.h"
```

## 5.62.2 Macro Definition Documentation

### 5.62.2.1 X\_SOH

```
#define X_SOH ((uint8_t)0x01u)
```

Start Of Header (128 bytes).

### 5.62.2.2 X\_STX

```
#define X_STX ((uint8_t)0x02u)
```

Start Of Header (1024 bytes).

### 5.62.2.3 X\_EOT

```
#define X_EOT ((uint8_t)0x04u)
```

End Of Transmission.

### 5.62.2.4 X\_ACK

```
#define X_ACK ((uint8_t)0x06u)
```

Acknowledge.

### 5.62.2.5 X\_NAK

```
#define X_NAK ((uint8_t)0x15u)
```

Not Acknowledge.

### 5.62.2.6 X\_CAN

```
#define X_CAN ((uint8_t)0x18u)
```

Cancel.

### 5.62.2.7 X\_C

```
#define X_C ((uint8_t)0x43u)
```

ASCII "C" to notify the host we want to use CRC16.

## 5.62.3 Enumeration Type Documentation

### 5.62.3.1 xmodem\_status

```
enum xmodem_status
```

xModem status enums

## Enumerator

|                |                               |
|----------------|-------------------------------|
| X_OK           | The action was successful.    |
| X_ERROR_CRC    | CRC calculation error.        |
| X_ERROR_NUMBER | Packet number mismatch error. |
| X_ERROR_UART   | UART communication error.     |
| X_ERROR_FLASH  | Flash related error.          |
| X_COMPLETE     | Generic error.                |
| X_ERROR        | Generic error.                |

## 5.62.4 Function Documentation

### 5.62.4.1 xmodem\_API\_receive()

```
xmodem_status xmodem_API_receive (
    void )
```

This function is the base of the Xmodem protocol. When we receive a header from UART, it decides what action it shall take.

## Parameters

|             |  |
|-------------|--|
| <i>void</i> |  |
|-------------|--|

## Returns

xmodem\_status

### 5.66.2 Function Documentation

#### 5.66.2.1 AppISR\_PreResetRoutine()

```
static void AppISR_PreResetRoutine ( ) [static]
```

Function to be invoked prior to resetting the system to recover from an hard fault/error.

Here is the caller graph for this function:

### 5.66.2.2 AppISR\_HALErrorHandler()

```
void AppISR_HALErrorHandler ( )
```

Error from STM HAL.

#### Warning

This function resets the device

Here is the call graph for this function:

### 5.66.2.3 AppISR\_ARMHandler()

```
void AppISR_ARMHandler ( )
```

Handler for errors from ARM core.

#### Warning

This function resets the device

Here is the call graph for this function:

#### 5.66.2.4 \_\_assert\_func()

```
void __assert_func (
    const char * file,
    int line,
    const char * func,
    const char * failedexpr )
```

Assert failure error handler.

##### Warning

This function resets the device

Here is the call graph for this function:

#### 5.66.2.5 HAL\_UART\_RxCpltCallback()

```
void HAL_UART_RxCpltCallback (
    UART_HandleTypeDef * huart )
```

STM HAL reception callback.

##### Parameters

|              |  |
|--------------|--|
| <i>huart</i> |  |
|--------------|--|

Here is the call graph for this function:

#### 5.66.2.6 HAL\_TIM\_PeriodElapsedCallback()

```
void HAL_TIM_PeriodElapsedCallback (
    TIM_HandleTypeDef * htim )
```

Timer callback associated with soft-timer, part of STM HAL.

**Parameters**

|             |                |
|-------------|----------------|
| <i>htim</i> | timer instance |
|-------------|----------------|

## 5.69.2 Function Documentation

### 5.69.2.1 FlashFS\_GetInstance()

```
static sFlashFS_t * FlashFS_GetInstance ( ) [static]
```

Get FlashFS file instance.

#### Returns

sFlashFS\_t\*

Here is the caller graph for this function:

### 5.69.2.2 FlashFS\_Init()

```
static eStorageFSStatus_t FlashFS_Init (
    sFlashFS_t *const pMe ) [static]
```

Initialize lfs.

#### Parameters

|            |                      |
|------------|----------------------|
| <i>pMe</i> | lfs wrapper instance |
|------------|----------------------|

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.69.2.3 \_\_attribute\_\_((unused))

```
__attribute__((unused))
```

Deinitialize LFS file system.

## Parameters

|            |                      |
|------------|----------------------|
| <i>pMe</i> | lfs wrapper instance |
|------------|----------------------|

## Returns

eStorageFSStatus\_t

### 5.69.2.4 FlashFs\_OpenFileRaw()

```
static eStorageFSStatus_t FlashFs_OpenFileRaw (
    sFlashFS_t *const pMe,
    eStorageFileNamesEnums_t fileEnum,
    eStorageFSOperationModes_t modeEnum ) [static]
```

Open a file in lfs.

## Parameters

|                 |                      |
|-----------------|----------------------|
| <i>pMe</i>      | Ifs wrapper instance |
| <i>fileEnum</i> | File to be opened    |
| <i>modeEnum</i> | Mode to open file In |

## Returns

eStorageFSStatus\_t

Here is the caller graph for this function:

## 5.69.2.5 FlashFs\_CloseFileRaw()

```
static eStorageFSStatus_t FlashFs_CloseFileRaw (
    sFlashFS_t *const pMe,
    eStorageFileNamesEnums_t fileEnum ) [static]
```

Close a file in Ifs.

## Parameters

|                 |                      |
|-----------------|----------------------|
| <i>pMe</i>      | Ifs wrapper instance |
| <i>fileEnum</i> | file to be closed    |

## Returns

eStorageFSStatus\_t

Here is the caller graph for this function:

### 5.69.2.6 FlashFs\_ReadFileRaw()

```
static eStorageFSStatus_t FlashFs_ReadFileRaw (
    sFlashFS_t *const pMe,
    eStorageFileNamesEnums_t fileEnum,
    char *const pOutReadBuf,
    uint32_t bytesToRead,
    int32_t *const pOutBytesRead ) [static]
```

read from a file in FlashFS

#### Parameters

|                      |                                    |
|----------------------|------------------------------------|
| <i>pMe</i>           | FlashFS wrapper instance           |
| <i>fileEnum</i>      | File to be read from               |
| <i>pOutReadBuf</i>   | read data will be saved here       |
| <i>bytesToRead</i>   | number of bytes to read            |
| <i>pOutBytesRead</i> | number of bytes read is saved here |

#### Returns

eStorageFSStatus\_t

Here is the caller graph for this function:

### 5.69.2.7 FlashFs\_WriteFileRaw()

```
static eStorageFSStatus_t FlashFs_WriteFileRaw (
    sFlashFS_t *const pMe,
    eStorageFileNamesEnums_t fileEnum,
    bool IsAppend,
    const char *const pInWriteBuf,
    size_t bufSize ) [static]
```

Write to a file in LFS.

#### Parameters

|                    |                                   |
|--------------------|-----------------------------------|
| <i>pMe</i>         | lfs wrapper instance              |
| <i>fileEnum</i>    | File to be written into           |
| <i>IsAppend</i>    | Unused Kept for API consistency   |
| <i>pInWriteBuf</i> | data to be written is passed here |
| <i>bufSize</i>     | size of buffer passed for writing |

## Returns

eStorageFSStatus\_t

<

## Warning

IsAppend Kept for API consistency, File should be opened in Append mode if Appending is needed

Here is the caller graph for this function:

## 5.69.2.8 FlashFs\_DeleteFile()

```
static eStorageFSStatus_t FlashFs_DeleteFile (
    const sFlashFS_t *const pMe,
    eStorageFileNamesEnums_t fileEnum ) [static]
```

Delete File.

## Parameters

|                 |                      |
|-----------------|----------------------|
| <i>pMe</i>      | lfs wrapper instance |
| <i>fileEnum</i> | File to be deleted   |

## Returns

eStorageFSStatus\_t

Here is the caller graph for this function:

## 5.69.2.9 FlashFs\_ComputeFileCRC()

```
static eStorageFSStatus_t FlashFs_ComputeFileCRC (
    sFlashFS_t *const pMe,
```

```
eStorageFileNamesEnums_t fileEnum,
uint8_t *const pInOutRamBuf,
uint32_t RamBufSize,
uint32_t *const pOutCRC ) [static]
```

compute CRC of requested file

#### Parameters

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <i>pMe</i>          | lfs wrapper instance                                                  |
| <i>fileEnum</i>     | File whose CRC needs to be computed                                   |
| <i>pInOutRamBuf</i> | Ram buffer that will be used as temporary storage while computing CRC |
| <i>RamBufSize</i>   | ram buffer size passed                                                |
| <i>pOutCRC</i>      | computed CRC will be saved here                                       |

#### Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.69.2.10 FlashFs\_API\_Init()

```
eStorageFSStatus_t FlashFs_API_Init ( )
```

API to initialize lfs.

**Returns**

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

**5.69.2.11 FlashFs\_API\_OpenGoldenImageFile()**

eStorageFSStatus\_t FlashFs\_API\_OpenGoldenImageFile ( )

Open Golden Image file.

**Returns**

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.69.2.12 FlashFs\_API\_WriteToGoldenImageFile()

```
eStorageFSStatus_t FlashFs_API_WriteToGoldenImageFile (
    const char *const pInWriteBuf,
    size_t bufSize )
```

Write to Golden Image file.

#### Note

AppStorage\_API\_OpenGoldenFile must be invoked prior to using this function

#### Parameters

|                    |                                                      |
|--------------------|------------------------------------------------------|
| <i>pInWriteBuf</i> | Contents to be written to Golden file is passed here |
| <i>bufSize</i>     | write buffer size                                    |

#### Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.69.2.13 FlashFs\_API\_CloseGoldenImageFile()

```
eStorageFSStatus_t FlashFs_API_CloseGoldenImageFile ( )
```

Close golden Image file.

#### Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.69.2.14 FlashFs\_API\_DeleteGoldenImageFile()

```
eStorageFSStatus_t FlashFs_API_DeleteGoldenImageFile ( )
```

Close golden Image file.

#### Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.69.2.15 FlashFs\_API\_ComputeGoldenImageFileCRC()

```
eStorageFSStatus_t FlashFs_API_ComputeGoldenImageFileCRC (
    uint8_t *const pInOutRamBuf,
    uint32_t RamBufSize,
    uint32_t *const pOutCRC )
```

compute CRC of golden Image file

#### Parameters

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <i>pInOutRamBuf</i> | Ram buffer that will be used as temporary storage while computing CRC |
| <i>RamBufSize</i>   | ram buffer size passed                                                |
| <i>pOutCRC</i>      | computed CRC will be saved here                                       |

**Returns**

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

## 5.69.3 Variable Documentation

### 5.69.3.1 gcOpModeToLittleFSModeConverterTable

```
const int gcOpModeToLittleFSModeConverterTable[eFS_MODE_MAX] [static]
```

**Initial value:**

```
= {
    [eFS_READONLY] = (LFS_O_RDONLY),
    [eFS_WRITEONLY] = (LFS_O_WRONLY),
    [eFS_READ_WRITE] = (LFS_O_RDWR),
    [eFS_READ_CREATE] = (LFS_O_RDONLY | LFS_O_CREAT),
    [eFS_WRITE_CREATE] = (LFS_O_WRONLY | LFS_O_CREAT),
    [eFS_WRITE_APPEND] = (LFS_O_WRONLY | LFS_O_CREAT | LFS_O_APPEND),
    [eFS_READ_WRITE_CREATE] = (LFS_O_RDWR | LFS_O_CREAT),
}
```

utility table that converts user file modes to littleFS file modes

### 5.69.3.2 gcFilesNamesTable

```
const char* const gcFilesNamesTable[eFS_MAX] = {[eFS_GOLDEN_IMAGE] = "fallback.txt", [eFS_↔
FILE_2] = "file2.txt"} [static]
```

Map Name enums to File name strings.

## 5.70 AppFlash\_API.h File Reference

```
#include <stdbool.h>
#include "crc.h"
#include "lfs.h"
#include "AppStorageDataStructures.h"
```

## 5.70.2 Function Documentation

### 5.70.2.1 FlashFs\_API\_Init()

```
eStorageFSStatus_t FlashFs_API_Init ( )
```

API to initialize lfs.

#### Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.70.2.2 FlashFs\_API\_OpenGoldenImageFile()

```
eStorageFSStatus_t FlashFs_API_OpenGoldenImageFile ( )
```

Open Golden Image file.

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.70.2.3 FlashFs\_API\_WriteToGoldenImageFile()

```
eStorageFSStatus_t FlashFs_API_WriteToGoldenImageFile (
    const char *const pInWriteBuf,
    size_t bufSize )
```

Write to Golden Image file.

## Note

`AppStorage_API_OpenGoldenFile` must be invoked prior to using this function

## Parameters

|                    |                                                      |
|--------------------|------------------------------------------------------|
| <i>pInWriteBuf</i> | Contents to be written to Golden file is passed here |
| <i>bufSize</i>     | write buffer size                                    |

**Returns**

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.70.2.4 FlashFs\_API\_CloseGoldenImageFile()

```
eStorageFSStatus_t FlashFs_API_CloseGoldenImageFile ( )
```

Close golden Image file.

**Returns**

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.70.2.5 FlashFs\_API\_DeleteGoldenImageFile()

```
eStorageFSStatus_t FlashFs_API_DeleteGoldenImageFile ( )
```

Close golden Image file.

Returns

`eStorageFSStatus_t`

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.70.2.6 FlashFs\_API\_ComputeGoldenImageFileCRC()

```
eStorageFSStatus_t FlashFs_API_ComputeGoldenImageFileCRC (
    uint8_t *const pInOutRamBuf,
    uint32_t RamBufSize,
    uint32_t *const pOutCRC )
```

compute CRC of golden Image file

## Parameters

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <i>pInOutRamBuf</i> | Ram buffer that will be used as temporary storage while computing CRC |
| <i>RamBufSize</i>   | ram buffer size passed                                                |
| <i>pOutCRC</i>      | computed CRC will be saved here                                       |

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.74.2 Function Documentation

#### 5.74.2.1 `lfs_device_prog()`

```
static int lfs_device_prog (
    const struct lfs_config * c,
    lfs_block_t block,
    lfs_off_t off,
    const void * buffer,
    lfs_size_t size ) [static]
```

read function provided to LittleFS

**Parameters**

|               |  |
|---------------|--|
| <i>c</i>      |  |
| <i>block</i>  |  |
| <i>off</i>    |  |
| <i>buffer</i> |  |
| <i>size</i>   |  |

**Returns**

int

**5.74.2.2 lfs\_device\_erase()**

```
static int lfs_device_erase (
    const struct lfs_config * c,
    lfs_block_t block ) [static]
```

Erase function provided to LittleFS.

**Parameters**

|              |  |
|--------------|--|
| <i>c</i>     |  |
| <i>block</i> |  |

**Returns**

int

**5.74.2.3 lfs\_device\_sync()**

```
static int lfs_device_sync (
    const struct lfs_config * c ) [static]
```

Erase function provided to LittleFS. Not supported by W25qxx.

**Parameters**

|          |  |
|----------|--|
| <i>c</i> |  |
|----------|--|

**Returns**

int

**5.74.2.4 lfsWrapper\_Init()**

```
int lfsWrapper_Init (
    lfs_t *const plfs )
```

Wrapper around littleFS initialization.

#### Parameters

|             |                          |
|-------------|--------------------------|
| <i>plfs</i> | pointer to lfs structure |
|-------------|--------------------------|

#### Returns

int non zero if error

< reformat if we can't mount the filesystem

< this should only happen on the first bootHere is the caller graph for this function:

## 5.74.3 Variable Documentation

### 5.74.3.1 cfg

```
const struct lfs_config cfg [static]
```

#### Initial value:

```
= {
    .read = lfs_device_read,
    .prog = lfs_device_prog,
    .erase = lfs_device_erase,
    .sync = lfs_device_sync,

    .read_size = LFS_READ_SIZE,
    .prog_size = LFS_PROG_SIZE,
    .block_size = LFS_BLOCK_SIZE,
    .block_count = LFS_BLOCK_COUNT,
    .cache_size = LFS_CACHE_SIZE,
    .lookahead_size = LFS_LOOKAHEAD_SIZE,
    .block_cycles = LFS_BLOCK_CYCLES,

    .read_buffer = lfs_read_buf,
    .prog_buffer = lfs_prog_buf,
    .lookahead_buffer = lfs_lookahead_buf,
}
```

configuration of the filesystem is provided by this struct

## 5.75 LittleFS\_Wrapper.h File Reference

```
#include <stdbool.h>
#include "lfs.h"
```

## Functions

- int `lfsWrapper_Init` (`lfs_t` \*const `plfs`)
- bool `lfs_Test` (void)

### 5.75.2 Function Documentation

#### 5.75.2.1 lfsWrapper\_Init()

```
int lfsWrapper_Init (
    lfs_t *const plfs )
```

Wrapper around littleFS initialization.

#### Parameters

|             |                          |
|-------------|--------------------------|
| <i>plfs</i> | pointer to lfs structure |
|-------------|--------------------------|

#### Returns

int non zero if error

< reformat if we can't mount the filesystem

< this should only happen on the first bootHere is the caller graph for this function:

## 5.80.1 Detailed Description

### Author

Vishal Keshava Murthy

### Version

0.1

### Date

2024-06-07

### Copyright

Copyright (c) 2024

## 5.80.2 Function Documentation

### 5.80.2.1 SDFs\_GetInstance()

```
static sSDFS_t * SDFs_GetInstance ( ) [static]
```

Get storage media instance.

### Returns

sSDFS\_t\*

Here is the caller graph for this function:

### 5.80.2.2 SDFs\_Init()

```
static eStorageFSStatus_t SDFs_Init (
    sSDFS_t *const pMe ) [static]
```

Initialize FatFS file-system.

## Parameters

|            |                        |
|------------|------------------------|
| <i>pMe</i> | FatFS wrapper instance |
|------------|------------------------|

## Returns

eStorageFSStatus\_t

Here is the caller graph for this function:

## 5.80.2.3 \_\_attribute\_\_((unused))

```
__attribute__((unused))
```

Initialize FatFS file-system.

Delete File.

Write to a file in FatFS.

## Parameters

|            |                        |
|------------|------------------------|
| <i>pMe</i> | FatFS wrapper instance |
|------------|------------------------|

## Returns

eStorageFSStatus\_t

## Parameters

|                    |                                                                            |
|--------------------|----------------------------------------------------------------------------|
| <i>pMe</i>         | FatFS wrapper instance                                                     |
| <i>fileEnum</i>    | File to be written into                                                    |
| <i>IsAppend</i>    | Pass true to write to file in append mode, false to write at the beginning |
| <i>pInWriteBuf</i> | data to be written is passed here                                          |
| <i>bufSize</i>     | size of buffer passed for writing                                          |

## Returns

eStorageFSStatus\_t

## Parameters

|                 |                        |
|-----------------|------------------------|
| <i>pMe</i>      | FatFS wrapper instance |
| <i>fileEnum</i> | File to be deleted     |

## Returns

eStorageFSStatus\_t

## 5.80.2.4 SDFs\_OpenFileRaw()

```
static eStorageFSStatus_t SDFs_OpenFileRaw (
    sSDFS_t *const pMe,
    eStorageFileNamesEnums_t fileEnum,
    eStorageFSOperationModes_t modeEnum ) [static]
```

Open a file in FatFS.

## Parameters

|                 |                        |
|-----------------|------------------------|
| <i>pMe</i>      | FatFS wrapper instance |
| <i>fileEnum</i> | File to be opened      |
| <i>modeEnum</i> | Mode to open file In   |

## Returns

eStorageFSStatus\_t

Here is the caller graph for this function:

## 5.80.2.5 SDFs\_CloseFileRaw()

```
static eStorageFSStatus_t SDFs_CloseFileRaw (
    sSDFS_t *const pMe,
    eStorageFileNamesEnums_t fileEnum ) [static]
```

Close a file in FatFS.

## Parameters

|                 |                        |
|-----------------|------------------------|
| <i>pMe</i>      | FatFS wrapper instance |
| <i>fileEnum</i> | file to be closed      |

## Returns

eStorageFSStatus\_t

Here is the caller graph for this function:

## 5.80.2.6 SDFs\_ReadFileRaw()

```

static eStorageFSStatus_t SDFs_ReadFileRaw (
    sSDFS_t *const pMe,
    eStorageFileNamesEnums_t fileEnum,
    char *const pOutReadBuf,
    uint32_t bytesToRead,
    uint32_t *const pOutBytesRead ) [static]
  
```

read from a file in FatFS

## Parameters

|                      |                                    |
|----------------------|------------------------------------|
| <i>pMe</i>           | FatFS wrapper instance             |
| <i>fileEnum</i>      | File to be read from               |
| <i>pOutReadBuf</i>   | read data will be saved here       |
| <i>bytesToRead</i>   | number of bytes to read            |
| <i>pOutBytesRead</i> | number of bytes read is saved here |

## Returns

eStorageFSStatus\_t

Here is the caller graph for this function:

## 5.80.2.7 SDFs\_ComputeFileCRC()

```
static eStorageFSStatus_t SDFs_ComputeFileCRC (
    sSDFS_t *const pMe,
    eStorageFileNamesEnums_t fileEnum,
    uint8_t *const pInOutRamBuf,
    uint32_t RamBufSize,
    uint32_t *const pOutCRC ) [static]
```

compute CRC of requested file

## Parameters

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <i>pMe</i>          | FatFS wrapper instance                                                |
| <i>fileEnum</i>     | File whose CRC needs to be computed                                   |
| <i>pInOutRamBuf</i> | Ram buffer that will be used as temporary storage while computing CRC |
| <i>RamBufSize</i>   | ram buffer size passed                                                |
| <i>pOutCRC</i>      | computed CRC will be saved here                                       |

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.80.2.8 SDFs\_GetFileSizeRaw()

```
static eStorageFSStatus_t SDFs_GetFileSizeRaw (
    const sSDFS_t *const pMe,
    eStorageFileNamesEnums_t fileEnum,
    uint32_t *const pOutFileSizeInBytes ) [static]
```

Get size of file in FatFS.

#### Parameters

|                            |                                         |
|----------------------------|-----------------------------------------|
| <i>pMe</i>                 | FatFS wrapper instance                  |
| <i>fileEnum</i>            | file whose size needs to be determined  |
| <i>pOutFileSizeInBytes</i> | size of the file computed is saved here |

#### Returns

eStorageFSStatus\_t

Here is the caller graph for this function:

### 5.80.2.9 SDFs\_GetFilePresent()

```
static eStorageFSStatus_t SDFs_GetFilePresent (
    sSDFS_t *const pMe,
    eStorageFileNamesEnums_t fileEnum ) [static]
```

Determine if a file is present in FatFS.

#### Parameters

|                 |                        |
|-----------------|------------------------|
| <i>pMe</i>      | FatFS wrapper instance |
| <i>fileEnum</i> | file to be checked     |

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.80.2.10 SDFs\_API\_Init()

```
eStorageFSStatus_t SDFs_API_Init ( )
```

Initialize FatFS wrapper.

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.80.2.11 SDFs\_API\_GetGoldenFileStatus()

```
eStorageFSStatus_t SDFs_API_GetGoldenFileStatus ( )
```

Check if file exists.

##### Returns

`eStorageFSStatus_t`

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.80.2.12 SDFs\_API\_OpenGoldenImageFile()

```
eStorageFSStatus_t SDFs_API_OpenGoldenImageFile ( )
```

Open Golden Image file.

#### Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.80.2.13 SDFs\_API\_GetGoldenImageFileSize()

```
eStorageFSStatus_t SDFs_API_GetGoldenImageFileSize (
    uint32_t * pOutFileSizeInBytes )
```

Get size of golden image.

#### Parameters

|                            |                                        |
|----------------------------|----------------------------------------|
| <i>pOutFileSizeInBytes</i> | size of the golden image is saved here |
|----------------------------|----------------------------------------|

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.80.2.14 SDFs\_API\_ReadGoldenImageFile()

```

eStorageFSStatus_t SDFs_API_ReadGoldenImageFile (
    char *const pOutReadBuf,
    uint32_t bytesToRead,
    uint32_t *const pOutBytesRead )
  
```

Read golden image file.

## Parameters

|                      |                                      |
|----------------------|--------------------------------------|
| <i>pOutReadBuf</i>   | contents of read file are saved here |
| <i>bytesToRead</i>   | bytes to read from file              |
| <i>pOutBytesRead</i> | bytes read from file                 |

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.80.2.15 SDFs\_API\_CloseGoldenImageFile()

```
eStorageFSStatus_t SDFs_API_CloseGoldenImageFile ( )
```

Close golden Image file.

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.80.2.16 SDFs\_API\_ComputeGoldenImageFileCRC()

```

eStorageFSStatus_t SDFs_API_ComputeGoldenImageFileCRC (
    uint8_t *const pInOutRamBuf,
    uint32_t RamBufSize,
    uint32_t *const pOutCRC )
  
```

compute CRC of golden Image file

##### Parameters

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <i>pInOutRamBuf</i> | Ram buffer that will be used as temporary storage while computing CRC |
| <i>RamBufSize</i>   | ram buffer size passed                                                |
| <i>pOutCRC</i>      | computed CRC will be saved here                                       |

##### Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.80.3 Variable Documentation

#### 5.80.3.1 gcOpModeToFatFSModeConverterTable

```
const uint8_t gcOpModeToFatFSModeConverterTable[eFS_MODE_MAX] [static]
```

**Initial value:**

```
=
{
    [eFS_READONLY]      = (FA_READ),
    [eFS_WRITEONLY]     = (FA_WRITE),
    [eFS_READ_WRITE]    = (FA_READ | FA_WRITE),
    [eFS_READ_CREATE]   = (FA_READ | FA_OPEN_ALWAYS),
    [eFS_WRITE_CREATE]  = (FA_WRITE | FA_OPEN_ALWAYS),
    [eFS_WRITE_APPEND]  = (FA_WRITE | FA_OPEN_ALWAYS),
    [eFS_READ_WRITE_CREATE] = (FA_READ | FA_WRITE | FA_OPEN_ALWAYS),
}
```

Utility table to convert user file-system modes to FatFS file system modes.

#### 5.80.3.2 gcFilesNamesTable

```
const char* const gcFilesNamesTable[eFS_MAX] [static]
```

**Initial value:**

```
=
{
    [eFS_GOLDEN_IMAGE] = "fallback.txt",
    [eFS_FILE_2]       = "file2.txt"
}
```

Map Name enums to File name strings.

## 5.81 AppSD\_API.h File Reference

### 5.81.2 Function Documentation

#### 5.81.2.1 SDFs\_API\_Init()

```
eStorageFSStatus_t SDFs_API_Init ( )
```

Initialize FatFS wrapper.

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.81.2.2 SDFs\_API\_GetGoldenFileStatus()

```
eStorageFSStatus_t SDFs_API_GetGoldenFileStatus ( )
```

Check if file exists.

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.81.2.3 SDFs\_API\_OpenGoldenImageFile()

```
eStorageFSStatus_t SDFs_API_OpenGoldenImageFile ( )
```

Open Golden Image file.

Returns

`eStorageFSStatus_t`

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.81.2.4 SDFs\_API\_GetGoldenImageFileSize()

```
eStorageFSStatus_t SDFs_API_GetGoldenImageFileSize (
    uint32_t * pOutFileSizeInBytes )
```

Get size of golden image.

## Parameters

|                            |                                        |
|----------------------------|----------------------------------------|
| <i>pOutFileSizeInBytes</i> | size of the golden image is saved here |
|----------------------------|----------------------------------------|

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.81.2.5 SDFs\_API\_ReadGoldenImageFile()

```
eStorageFSStatus_t SDFs_API_ReadGoldenImageFile (
    char *const pOutReadBuf,
    uint32_t bytesToRead,
    uint32_t *const pOutBytesRead )
```

Read golden image file.

## Parameters

|                      |                                      |
|----------------------|--------------------------------------|
| <i>pOutReadBuf</i>   | contents of read file are saved here |
| <i>bytesToRead</i>   | bytes to read from file              |
| <i>pOutBytesRead</i> | bytes read from file                 |

## Returns

eStorageFSStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.81.2.6 SDFs\_API\_CloseGoldenImageFile()

```
eStorageFSStatus_t SDFs_API_CloseGoldenImageFile ( )
```

Close golden Image file.

**Returns**

`eStorageFSStatus_t`

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.81.2.7 SDFs\_API\_ComputeGoldenImageFileCRC()

```
eStorageFSStatus_t SDFs_API_ComputeGoldenImageFileCRC (
    uint8_t *const pInOutRamBuf,
    uint32_t RamBufSize,
    uint32_t *const pOutCRC )
```

compute CRC of golden Image file

#### Parameters

|                     |                                                                       |
|---------------------|-----------------------------------------------------------------------|
| <i>pInOutRamBuf</i> | Ram buffer that will be used as temporary storage while computing CRC |
| <i>RamBufSize</i>   | ram buffer size passed                                                |
| <i>pOutCRC</i>      | computed CRC will be saved here                                       |

#### Returns

eStorageFSStatus\_t

Here is the call graph for this function:

## 5.83.2 Function Documentation

### 5.83.2.1 AppStorage\_SetPower()

```
void AppStorage_SetPower (  
    bool IsEnable )
```

Set Sensor power for powering external flash board.

## Note

SPI also needs to be controlled here since power on SPI pins is also powering the external board

Here is the caller graph for this function:

### 5.83.2.2 AppStorage\_GetCurrentTransferMode()

```
eTransferMode_t AppStorage_GetCurrentTransferMode ( )
```

Get current transfer mode setting.

## Returns

eTransferMode\_t

Here is the caller graph for this function:

### 5.83.2.3 AppStorage\_TransferGoldenImageFileFromSDToFlash()

```
eStorageFSStatus_t AppStorage_TransferGoldenImageFileFromSDToFlash ( )
```

Transfer Golden Image from SD card to flash.

Returns

eAppStorageStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.83.2.4 AppStorage\_CompareCRCOfGoldenImageFileInSDAndFlash()

```
eStorageFSStatus_t AppStorage_CompareCRCOfGoldenImageFileInSDAndFlash (
    bool *const pOutIsCRCMatching )
```

Compute and compare CRC of golden Image file stored in CRC and Flash.

## Parameters

|                          |                                              |
|--------------------------|----------------------------------------------|
| <i>pOutIsCRCMatching</i> | Set to true if CRC matches, False otherwise. |
|--------------------------|----------------------------------------------|

## Returns

eAppStorageStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

## 5.83.3 Variable Documentation

### 5.83.3.1 gcTransferModeToGPIOStatusMappingTable

```
const eTransferMode_t gcTransferModeToGPIOStatusMappingTable[eTX_MODE_MAX] [static]
```

**Initial value:**

```
= {
    [eTX_MODE_SDCARD_TO_FLASH] = GPIO_PIN_RESET, [eTX_MODE_XMODEM_TO_FLASH] = GPIO_PIN_SET}
```

utility mapping of Transfer mode [eTransferMode\\_t](#) to GPIO state

## 5.84 AppStorage.h File Reference

```
#include <stdbool.h>
#include "AppStorageDataStructures.h"
```

## Macros

- `#define FLASH_POWER_EN_PORT` (SENSOR\_POWER\_ENABLE\_GPIO\_Port)
- `#define FLASH_POWER_EN_PIN` (SENSOR\_POWER\_ENABLE\_Pin)
- `#define TRANSFER_MODE_PORT` (TRANSFER\_MODE\_GPIO\_Port)
- `#define TRANSFE_MODE_PIN` (TRANSFER\_MODE\_Pin)

## Enumerations

- enum `eTransferMode_t` { `eTX_MODE_SDCARD_TO_FLASH` , `eTX_MODE_XMODEM_TO_FLASH` , `eTX_↵  
_MODE_MAX` }

## Functions

#### 5.84.2.1 `eTransferMode_t`

enum `eTransferMode_t`

Enumerations for storage mediums supported.

### 5.84.3 Function Documentation

#### 5.84.3.1 AppStorage\_SetPower()

```
void AppStorage_SetPower (
    bool IsEnable )
```

Set Sensor power for powering external flash board.

##### Note

SPI also needs to be controlled here since power on SPI pins is also powering the external board

Here is the caller graph for this function:

#### 5.84.3.2 AppStorage\_TransferGoldenImageFileFromSDToFlash()

```
eStorageFSStatus_t AppStorage_TransferGoldenImageFileFromSDToFlash ( )
```

Transfer Golden Image from SD card to flash.

##### Returns

eAppStorageStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.84.3.3 AppStorage\_CompareCRCOfGoldenImageFileInSDAndFlash()

```

eStorageFSStatus_t AppStorage_CompareCRCOfGoldenImageFileInSDAndFlash (
    bool *const pOutIsCRCMatching )
  
```

Compute and compare CRC of golden Image file stored in CRC and Flash.

#### Parameters

|                          |                                              |
|--------------------------|----------------------------------------------|
| <i>pOutIsCRCMatching</i> | Set to true if CRC matches, False otherwise. |
|--------------------------|----------------------------------------------|

#### Returns

eAppStorageStatus\_t

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.84.3.4 AppStorage\_GetCurrentTransferMode()

`eTransferMode_t` AppStorage\_GetCurrentTransferMode ( )

Get current transfer mode setting.

Returns

`eTransferMode_t`

Here is the caller graph for this function:
